1. Need 1GHz RF wattmeter

Newsgroup: rec.ham-radio

Where can I get a low-cost RF wattmeter good for 1.2GHz? The power range required is 50mW to 5W or so at 50 ohms. Either an inline or terminating type wattmeter is acceptable; an SWR capability would be nice but is not essential. Precision required is very modest.

It's easy to find wattmeters for low bands, but it's hard for UHF. Any ideas?

While it won't give you great resolution at power levels of 50 mW,
the cheapest off-the-shelf solution is to get some high frequency elements
for a Bird 43. You can get 1, 2.5 and 5 watt elements (P/N's 1K, 2.5K and
5K, respectively) that cover 1.1 to 1.8 GHz. These elements will also work
with a Bird 4381 or 4391.

You can go the Hewlett-Packard route. Now before you complain
about this not being "low cost", bear in mind that there is a lot of H-P
equipment in labs that you could possibly borrow. Furthermore, H-P
power meters (of the analog variety, at least) are pretty common and
inexpensive on the surplus market.

An H-P 432A or 432B power meter with 478A thermistor mount will
give you 10 mW full scale up to 10 GHz. All you need is a coaxial power
divider to bring the thermistor mount into range.

An H-P 435A or 436A with 8481H or 8482 thermocouple mount will
read directly to 3 watts.

I personally have a 435A with 8481H, would recommend that as the
best of all of the above for your application (unless you have access to
the 436A, which has a digital readout). If you really need to go to 5 W,
a power divider is trivial.

Would most of your measurements be closer to 5 watts or 50 mW ? Bird Electronics makes a variety of elements for thier Model-43 Thruline wattmeter covering the 23cm band. I have three of them here that I use for 1.2Ghz. They are: 5K (1.1-1.8 Ghz, 5W), 433-103 (1.1-1.8 Ghz, 50W), and an old military CU-1677/URM-167 (1.0-1.8 Ghz 25W). I have also seen some 2.4 Ghz slugs (10W & 25W) that they manufacture. And..... in my Model-43 manual they list slugs covering 1.1-1.8 Ghz with 1W, 2.5W, 5W, 10W and 25W full scale.

I'll admit that Bird may not actually be the "least expensive" wattmeter you can find. But its hard to beat its flexibility for $170. In case your interested, Bird's number is 216-248-1200. Good luck.

73, John

SpaceNews

MONDAY JANULARY 2, 1989

SpaceNews originates at KD2BD in Wall Township, NJ, and is available on
packet radio bulletin board stations across the North America and around
the world on the MTTBS telephone BBS at (201) 494-3649, the Unix USENET
News Network, and WangNet.

* ASR IS GONE *

Reliable sources have indicated that AMSAT-NA's bi-weekly newsletter,
"Amateur Satellite Report", will be phased out shortly and will
be replaced by a new bi-monthly publication dealing with more technical
Amateur satellite communications topics. These publications are sent to
to all members of AMSAT-NA.

For information on joining AMSAT-NA, the Radio Amateur Satellite Corporation
of North America, write:

AMSAT-NA
Radio Amateur Satellite Corporation
Post Office Box 27
Washington, DC 20044 USA

* OSCAR-9 NEWS *

UoSAT-OSCAR 9 Weekly Operating Schedule :

TUE : Diary reload occurs. VHF-FM beacon is OFF the air.
WED : CCD Video transmission - 1200 baud synchronous data.
THU : Digitalker sends telemetry in English until 14:00 UTC.
After 18:00, the Diary will transmit a sequence of TELEMETRY, BULLETIN
and WOD using 1200 baud ASCII until next Tuesday, when a reload occurs.

The 145.825 MHz NBFM General Data Beacon is ON the air according to
the above schedule. In addition, the 14.002 and 21.002 MHz beacons
are currently active sending Morse telemetry and A0 using 100 mW
of power. The 2.4 GHz FM beacon is OFF the air.

* RS10/RS11 NEWS *

Reports indicate that RS11 currently active, and that only its mode A
transponder is in operation at present.

* OSCAR-12 NEWS *

The current operating schedule for FO-12 is as follows:

Mode Until
Date Time
----+-------+-----
JD : 30Dec : 2254
D : 31Dec : 0002
JA : 03Jan : 2322
D : 04Jan : 2228

Mode D : All transponders are OFF.
Mode JA : Analog transponder is ON.
Mode JD : Digital transponder is ON.

* OSCAR-13 NEWS *

This operating schedule should remain in effect until 06Jan89,
when a change in spacecraft attitude will be made.

Mode Mean Anomaly
----+--------------
OFF : 240 to 003
B : 003 to 100
L : 100 to 150 (JL optional)
B : 150 to 240

Bahn coordinates for OSCAR-13 after the 06Jan89 attitude change will be
BLON: 0 degrees, BLAT: 180 degrees.

Scheduled mode S sessions will be announced on OSCAR-13's beacon.

* SpaceNews NEWS *

Sorry for the delay in this week's and last week's SpaceNews distribution.
I've been busy with a few ham radio projects here, and have not had the time
to put these articles together.

I receive LOTS of mail regarding SpaceNews. I try to respond to each message
indivdually, but lack of time makes it hard to answer everyone's questions.

I hope to carry some mini-tutorials on Amateur Satellite operations in the
near future, and answer questions like, "How do you decode EPOCH date and
time into HH:MM:SS", define what Keplerian Elements are and how they are used
in satellite tracking and orbit predictions, and heep everyone posted on
this year's planned MicroSat launch.

Oh, and I will continue to keep posting SpaceNews on USENET under the newsgroups of rec.ham-radio and sci.space.shuttle (sorry, I don't have access to sci.space here). Thanks for all the comments received.

--- John, KD2BD.

I am looking for a source for the software package called NEEDS, which I
believe stands for Numerical Electromagnetic Evaluation and Design Software.
I understand that NEEDS contains the latest version of the MiniNEC code as
well as a version of the NEC which will run on a personal computer. I believe
a plotting package is also included in the software as well as other utilities
such as optimization programs for antenna systems.

The person who told me about this package also mentioned the Applied Compu-
tational Electromagnetics Society and the Naval Ocean Systems Center, but this
is all I currently know about NEEDS.

If anyone has any additional information on the NEEDS package, or how I might
purchase a copy, please EMAIL me at the address below (or telephone). Thanks!

6. Optimod: how does it work ?

Newsgroup: rec.ham-radio

Here in Europe, more and more radio and TV-stations are using a device called "Optimod" for improving sound modulation. It's produced by an American company called "Orban". Using this device, the audio signal seems to have more loudness. Does anybody on the net know how this works ? Is it just some smart compression/limiting of the dynamic range of the audio signal or is there more to it ?

Optimod[tm] is a trade name for a variety of signal processing
widely used in broadcasting. I have worked with Optimod-AM quite extensively
and with products from competing companies, and can state that properly
set up, Optimod seems to do a decent job.

The Optimod system consists of basically three sections:

A wideband, gated AGC amplifier;
A multi-band compressor
Peak limiting and (in the AM case) bandpass filtering;
negative and positive peaks are adjustable separately for
Optimod-AM.

The "gating" of the AGC amplifier prevents the AGC from going
to maximum gain during pauses in the program or otherwise quiet passages.
The gating is adjustable to a specific RMS level; with the gating off,
it's a wideband compressor.

The multiband compressor is purported to have the time constants
and bandwidths required for the most natural increase in loudness without
audible effects. THe advantage of the multiband compressor is that,
judiciously used, it has the ability to equalise program material to
a more "uniform" sound. This isn't really a bad idea when you own an
AM radio station, and have less-than-ideal sources, from CD's all the way
down to your news reporter's cassette deck and Traffic Patrol.

Peak limiting is the time-honoured trick of increasing the RMS
of the signal by, er, deliberately clipping the peaks. The Optimod does
this reasonably tastefully, and allows you to adjust the clipping threshold
from -3 dB to + 2 dB for negative peaks, and similarly for positive peaks.
An elliptical output filter allows this clipped audio to have reasonable
overshoot characteristics when it leaves the Optimod.

The Optimod does have a phase scrambler (all pass filter) which
takes the assymetry out of normal speech and music programmes. This helps
prevent certain types of transmitters from grossly overmodulating during
"difficult" recordings. The phase scrambler might be in Optimod-FM as

well.

Finally, there is parametric EQ after the wideband AGC, with both bandwidth, center, and gain adjustable for bass and treble frequencies. The Optimod-AM also has some adjustable single order filters for tilt and overshoot compensation of older transmitters.

Orban do make other products, such as Optimod-FM (the Optimod 8000 is mostly a stereo generator with some compression, the 9000 being sort of the Optimod-AM with the stereo generator). When Optimod-FM was introduced, it was the benchmark of stereo generators, and it is still damn good. They also make a TV stereo sound system for BTSC. Orban also manufactures a line of studio toys, such as parametric EQ, de-essers, compressors, etc.

Eric Small left Orban and (I guess) formed Modulation Sciences, Inc., another manufacturer of this kind of stuff.

I personally like the Optimod AM, but the chief engineer at our Boston radio station has pasted over the front panel so that it reads IM -AM (I guess for intermodulation...). Compression and EQ is a matter of taste and virtually a black art. In the US, there is more anxiety over audio processing and its supposed relationship to cumulative audiences than probably any other single thing in a major market station.

Hope this helps...
York David Anthony
WKTD Wilmington, NC

We had an Optimod in our station eight years ago. They were quite the
rage back then. They also did the stereo encoding. It was a cute
little box you stuffed L+R into and it fed in to the FM exiter.
Other than a real cute multifunction meter we never messed with
the controls, so I can't tell you what it did.

-Ron

WABX in Detroit, which is no longer on the air, used an Optimod unit around '79 or so, I found out in a strange way. My cousin (WD8CBO) worked at a FM station in Flint Michigan and gave me a tour which included their new toy, the Optimod. Several weeks later I noticed that my woofers were dancing around while listening to WABX. They normally did that while using a turntable, but not the tuner. I called the station and asked the chief engineer about it. When I asked if they had "adjusted" their optimod he was shocked I even knew what an optimod was and wanted to know where I got my info from. He had taken a sub-sonic filter out of their optimod because he felt it "muddied up" the bass. Both of us were surprised that this low freq stuff was being received so well. My speakers don't have covers so it was very noticable. About a week later the problem was gone. I don't know what he did, but it worked.

SpaceNews

MONDAY JANUARY 9, 1989

SpaceNews originates at KD2BD in Wall Township, NJ, and is available on
packet radio bulletin board stations across the North America and around
the world on the MTTBS telephone BBS at (201) 494-3649, the Unix UUCP
USENET News Network, and also on WangNet.

* MINI-TUTORIAL: DECODING OSCAR-9 TELEMETRY *

Decoding and analyzing OSCAR-9 telemetry is a easy for anyone having an
HF receiver available to them. UoSAT-1 (OSCAR-9) currently transmits on
21.002 and 14.002 MHz using 10 WPM CW and 100 mW of transmitter power.
OSCAR-9 also transmits on VHF, but uses 1200 baud ASCII for downlinking
digital information to Amateur Radio ground stations around the world.
I occasionally post news bulletins I receive from OSCAR-9 on VHF.
Look for these bulletins on systems that also carry SpaceNews.

OSCAR-9's telemetry contains 60 analog "channels" that are transmitted by
it's on-board computer to ground stations. On HF, however, only the first
10 channels are downlinked by the HF beacon(s).

The format for OSCAR-9's HF telemetry is: NNDDD, where NN is a two digit
channel number, and DDD is a three digit telemetry value that is used as
as the argument of a calibration equation. Calibration equations are used
to convert the "raw" telemetry data values into real units like milliamperes,
volts degrees Celsius and nanoTeslas.

An OSCAR-9 CW telemetry "frame" might look something like:

AMSAT 00380 01370 02661 03481 04598 05046 06027 07056 08040 09033

Notice that the channel numbers range from 00 to 09. The numbers following
these numbers are the raw telemetry values that are substituted into
the calibration equations for decoding the actual telemetry data.

Each calibration equation was calculated to give the best "straight-line"
fit to the actual measured performance of the telemetry sensor before launch.

Equations for OSCAR-9's first ten analog telemetry channels are as follows:

00 : SECONDARY SPACECRAFT COMPUTER CURRENT : I = 1.2N (mA)
01 : SOLAR ARRAY CURRENT (+X FACET) : I = 200 + 1.12N (mA)
02 : BATTERY HALF VOLTAGE : V = N/100 * 1.01 (volts)
03 : RADIATION DETECTOR A OUTPUT : Count = 40N * (1.04)
04 : RADIATION DETECTOR B OUTPUT : Count = 40N * (1.04)
05 : MAGNETOMETER EXPERIMENT HX-COARSE : Bx = (129N - 64824) (nT)
06 : MAGNETOMETER EXPERIMENT HY-COARSE : By = (129N - 64433) (nT)
07 : MAGNETOMETER EXPERIMENT HZ-COARSE : Bz = (129N - 64072) (nT)
08 : BATTERY PACK-A TEMPERATURE : Temp = (474 - N)/5 * (1.01) (C)
09 : SPACECRAFT FACET TEMPERATURE : TEMP = (474 - N)/5 * (1.01) (C)

Listen for OSCAR-9 from around 7:00 to 9:00 (AM & PM) local time each day. If you hear the spacecraft and decode the telemetry, send me a note, and I'll include your data in an upcoming SpaceNews issue.

If you have a narrow-band FM receiver capable of receiving 145.825 MHz, you can try listening for OSCAR-9 on VHF also. On Thursday's you'll be able to hear OSCAR-9's "Digitalker" speak selected telemetry data in plain english (yes, you CAN hear non-human voices from space!).

Good luck!

* OSCAR-9 NEWS *

UoSAT-OSCAR 9 Weekly Operating Schedule :

TUE : Diary reload occurs. VHF-FM beacon is OFF the air.
WED : CCD Video transmission - 1200 baud synchronous data.
THU : Digitalker sends telemetry in English until 14:00 UTC.
After 18:00, the Diary will transmit a sequence of TELEMETRY, BULLETIN and WOD using 1200 baud ASCII until next Tuesday, when a reload occurs.

The 145.825 MHz NBFM General Data Beacon is ON the air according to the above schedule. In addition, the 14.002 and 21.002 MHz beacons are currently active sending Morse telemetry and A0 using 100 mW of power. The 2.4 GHz FM beacon is OFF the air.

Optimods are just pretty smart compressor limiters. They have 6 band
compression and wideband limiting + filtering too. The idea is to
get the carrier as modulated as possible for as much of the time as
possible, if you see what I mean. Orban make a version for use on
AM (good), one for FM (bad), and for TV (don't know, but probably
ugly). If you want an FM processor, Inovonics is a good bet.

>do the trick. Any opinions out there? Thanks.

That modification is described in the June 1987 QST (with a follow-up correction to the PC foil layout in the July 1987 QST). There are basically three levels of modification: 1) Frequency, 2) Squelch, and 3) Scanning.

Keep in mind that the cube was never a particularly sensitive or selective receiver to begin with, and it may overload in the presence of very strong signals. All things considered, though, it is a fun, inexpensive project that has great educational possibilities.

By the way, that conversion was born right here at Cornell University, by Steve Powell (N2BU - steve@calvin.ee.cornell.edu), with help from Joe Pingree (WB2TVB - joe@calvin.ee.cornell.edu).

Yup, I just bought one to replace my old-but-faithful (mint condition) Bearcat 160 (it was also tied to a desk, unfortunately. The generator trailer for my backpack was just too loud), and I was wondering if anybody has mods for the beast. Any and all replies are welcomed and thanks in advance.

Remember, that's a BC70XLT. For the 160, see misc.forsale.

To date I have seen a couple of follow-ups to the above, one indicated
that that is part of ham-radio, another indicated that packet had a
a new group created for it to move that traffic out of general ham-radio
discussions.

I would tend to agree with the idea that the ongoing discussions in
rec.ham-radio on a no-code/yes-code license and of other proposals for
changing the Amateur Radio Licence structure are of such volume that
those discussions might be moved into a dedicated group for those who
are interested to present their viewpoints without filling up rec.ham-radio.

CALL FOR DISCUSSION:

In line with accepted net practices, I would like to call for discussion
the formation of:

rec.ham-radio.licensing

Discussion might also indicate other possable names and/or guidelines
for such a group.

Althought this is posted to both rec.ham-radio and news.groups, the proper
place for this discussion is (I understand) news.groups.

For readers of the INFO-HAMS mailing list, I will also monitor that for
any discussion which you are unable to post to news.groups and summarize
and re-post that summery to news.groups prior to any call for votes.

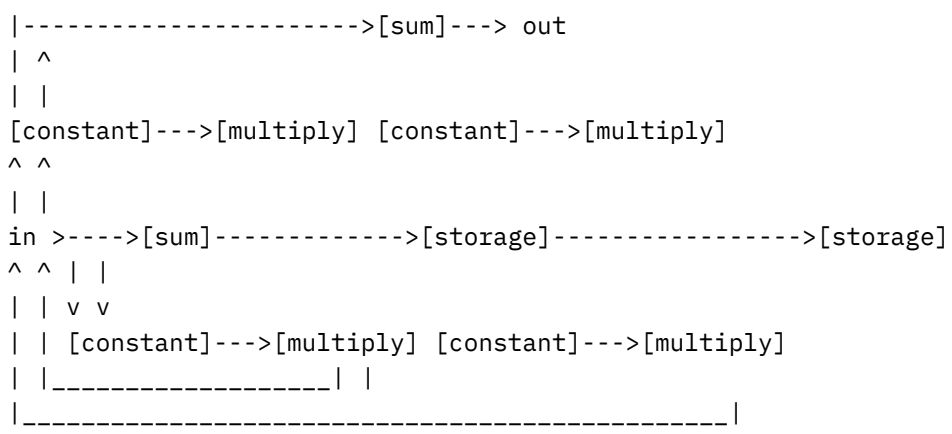
Okay, so what does a Hilbert transform look like?
I know some digital filters look like:



Where the four constants determine the characteristics of the filter.

Would suitable constants transform this into a Hilbert filter????

>Okay, so what does a Hilbert transform look like?

Because a Hilbert Transformer is not a linear-phase device, by far the easiest way to build one in DSP is with a FIR (finite impulse reponse) filter. Just load up the coefficients in a table and run through them like any other FIR filter. Any of several standard texts on DSP, e.g., Rabiner and Gold, can tell you how to compute the optimum coefficients for a FIR Hilbert Transformer of a given length.

The FIR is much preferred over the IIR (infinite impulse response) filter design you presented, because it allows the kind of precise control over filter phase characteristics that is the whole point of the Hilbert Transform.

Phil

[Phil talks about Hilbert transformers (filters)]

Actually, a Hilbert transformer is linear-phase, just discontinuous
at w = 0. It's phase response is -j for 0 < w < pi and +j for -pi < w < 0.
It's magnitude is 1 for all frequencies. Analog people call it a 90deg.
phase shifter.

An FIR filter can realize the phase response exactly, but can only
approximate the magnitude response. One approach to a design is to
window the ideal impulse response of (2sin**2(pi n / 2))/ (pi * n).

An IIR filter can achieve the unit magnitude characteristic (all-pass),
but can only approximate the phase characteristic. One advantage of IIR
is less overall delay.

Local wide-area-coverage 2 meter repeater frequencies are

in out
146.04 - 146.64
146.13 - 146.73
147.75 - 147.15

and about a dozen others with lesser coverage or restricted membership.

The 04/64 machine is the local playground; more traditional (i.e.,
oriented toward the older ham) activities take place on 13/73. Tuesday
at 9pm on 13/73 is the local packet radio "net" if you're into packet.

The conference hotel is in an area of town often referred to as Radio
Gulch, but many repeaters are usable from there. If you were at the San
Diego ARRL convention, it's the same hotel, minus the 60ft portable tower
we had up then.

24. Building a simple home circuit to read data off remote crt screen

Newsgroup: rec.ham-radio
Date: 1989-01-23 04:54:47 UTC
From: die@cpoint.UUCP
Message-ID: <2010@cpoint.UUCP>
Source record: 19548
Cross-posted to: sci.electronics,rec.ham-radio

A year or so ago I saw a demo on TV (on ABC's Nightline I think) of
what was refered to as a simple device that could be built with $25
worth of parts that could recover an image of the text on a CRT display
belonging a nearby PC or terminal from its spurious electromagnetic radiation.

The demo, done in London to circumvent strong US government opposition
to demoing this technology on commercial TV, showed a somewhat noisy but
quite readable image of text on the screen of a PC about 25 feet away from
the loop antenna used to pick the signal up.

Does anyone know what the $25 circuit consists of ?
Can it really be built for $25 ?

Some thoughts

It is quite clear that the video circuitry in a monitor radiates
broadband pulses with a spectral peaks at the ringing frequencies of the video
circuitry (eg. the wires to the tube ring like a spark transmitter when
excited by the hf energy contained in the bright/dark and dark/bright
transistions). And it is also clear that a monitor radiates lots of
energy at harmonics of its sweep frequency (try using a VLF receiver
near a TV).

To me the obvious thing to do is to recover phase lock to the
horizontal sweep by locking on to some harmonic, and divide that reference
down to generate frame/field timing. The data might be recovered by
generating a sample pulse delayed by a variable digital time delay circuit
from the phase locked timing reference and using that pulse to sample
the output of an envelope detector following a very broadband hf to vhf
amplifier driven by the pickup loop antenna. By averaging thousands of these
pixel wide samples and then slowly sweeping the time delay by one pixel at a
time one could very slowly reconstruct the image. Naturally this could be
done much faster (but not for $25) by using a modified frame grabber as
the correlator. Another technique involves video frequency analog ccd
shift registers in a correlator.

Is there a better way of doing this I am missing ?

This very topic is the cover story in the Winter 1988 issue of _Abacus_
(vol 5 no 2). The title of the article is "The Tempest over Leaking
Computers." The author is Harold Joseph Highland. Allow me to
quote a paragraph from the article:

"Anyone can put together a primitive eavesdropping unit for
somewhat over $100. All you need is a portable television set with a
voltage-controlled oscillator (VCO) tuner (one with no detents or
stops between the channels and no fine tuning control), a dipole
antenna with a 75-ohm balum (a balance transformer to match the
impedance of the antenna with that of a television set's cable), and a
75-ohm cable to connect the set to the antenna's balum. The unit will
have a limited range, between 20 and 40 feet, and the reception may be
poor because the picture will be unsteady. If extensions are used
with the vertical and horizontal hold controls for finer tuning,
picture quality will improve. With some knowledge of television
design and construction, you could build a more efficient unit at
higher cost. The circuit diagram of a TV set with a VCO tuner is
available in Sams Photofact #2218, a series used by many television
repair shops.

This equipment was designed by a man named Wim van Eck. He "noted
that with slightlymore sophisticated and expensive equipment, it was
possible to intercept data from a VDT screen up to 1 kilometer away."

The article is a kind of weird mix between gossip, basic
electromagnetic theory, technical details, and government regulations.
Thoroughly interesting.

Communications Research Centre has developed a pre-processor package
for the HF Ionospheric Communications Analysis and Prediction
program (IONCAP for IBM-pc). The data entry program is called
Ionhelp and runs on IBM-pc type computers.

Ionhelp generates output data in the format required by Ioncap
program. The built-in context sensitive help information,
pre-programmed selection menus simplifies data preparation. The data
validation for the data entered reduces operator errors.

The Ionhelp program and user's manual is available to the
interested organizations free of charge. To obtain a copy, send an
official letter requesting Ionhelp with a formatted floppy to my
address. This package does not include Ioncap program.

Department of Communications makes no warranties as to the contents
of the Ionhelp manual, Ionhelp software package and specifically
disclaims any implied warranties of merchantability or fitness for
any particular purpose. Also further reserves the right to make
changes to the specifications of the program and the contents of
the manual without obligation to notify any person or organization
of such changes.

Department of Communications makes no warranties on the results of
the Ioncap program and has no relationship to the originators and
suppliers of Ioncap package. Ioncap program and the user's manual
is property of the United States Government.

OK, net, here's a question for you:

I know what a real MOSFET looks like and I have a vague notion of how it works but how about this: Say we get a piece of, say, N type silicon and we oxidize it and stick on a gate. Now we etch the Si so that it is very thin under the gate. Is this thing now a MOSFET even though there is no junction nearby? Does the MOSFET actually need the junction between the substrate and the channel?

Next step: replace the semiconductor with a metal (Making a MOMFET!) - increasing the gate voltage to a sufficiently high level should eventually drive away all the free electrons rendering the channel an insulator. What field strength would this require?

Lastly: for my own arcane reasons I am interested in actually making a transistor. I don't want to have to make ultrapure silicon - is there some other semiconductor (e.g., copper oxide) that would be easier to use? I don't care if it is a good transistor; gains of around 10 would be just fine.

While we are at it: I read somewhere that when junction transistors were perfected research on point-contact transistors ceased and that they are still poorly understood. Is this true? If not, how do they work?

Cross-posted to: rec.ham-radio,sci.electronics

The standard method to repair intermittents is to alternately heat up and cool down the circuit. Heating is easy using a soldering iron or heat gun.
However, the can of "freeze" stuff I had contained freon. Since it is now positively known that freon destroys the ozone layer what chemical or process can I use to cool a PC board down.
Does anyone have any ideas or know of non-freon based "freeze"?

Hmmm, interesting question. Presumably, you're proposing to etch the
Si back from the opposite side that you've just metallized. In
principle, you could do this, but in practice, you'd have a very
hard time controlling the characteristics of the device. The problem
is that leakage along the exposed face would be very high-- you'd have
a quite nonlinear, very noisy resistor. It's highly unlikely you'd be
able to "pinch" the channel off, hence you'd have (virtually) no
transistor action. You don't need the junction with the substrate
(sometimes called the "back gate") to have a MOSFET... this is similiar
to the structure of semiconductor-on-insulator (SOI) transistors.
>
>Next step: replace the semiconductor with a metal (Making a MOMFET!) -
>increasing the gate voltage to a sufficiently high level should eventually
>drive away all the free electrons rendering the channel an insulator.
>What field strength would this require?

Now you're in trouble! You can fabricate useful devices in semiconductors
because the mobile charge in specific volumes of space can be controlled
quite accurately. Trying to fabricate a device in which you control
the charge flowing laterally in a metal under the control of a "vertical"
electric field presents many practical problems. First, the electric
field rises very quickly as a function of distance in a metal as charge
is forced away from its surface. This presents one of (at least) two
practical problems. Either you need a layer of metal which is no more
than a few interatomic distances thick (say about a hundred Angstroms),
or an insulator which can withstand huge electric fields without
breaking down electrically. In fact, the space-charge in a metal
drops to its equilibrium value exponentially as a function of distance
into the metal, so the second possibility is out of the question.
Unfortunately, the atoms in extremely thin layers of metal have a tendency
to move under the influence of applie electric field, eventually
causing the failure of your device There are other practical macroscopic
problems which would be observed, and undoubtedly some interesting
quantum-mechanical ones in a layer this thin, as well.

This goes back a ways, but if I remember this right, Lillenfield (or some
similar name) applied for a patent around the turn of the century for
a field controlled resistor using aluminum oxide. I'll try to dig up
a reference to this, but undoubtedly someone else has this at the tip
of their tongue (or fingers).

>

This is a real problem - As Joe says, freon is nasty to the ozone.
The previous "Solution" to the freezer spray was vinyl chloride -
a carcinogen.

Dry ice would do to cool the whole board, but not readily usable
for component by component testing.

One of the Scientific American "Amateur Scientist" columns,
from the early '70s, I think, described how to make a crude FET.

It noted that people almost discovered FETS long before the Bell Labs
transistor.

>Does anyone have any ideas or know of non-freon based "freeze"?

The component "freeze" sprays are generally dichlorodifluoromethane, often called Freon-12 or Refrigerant-12; they are one member of a family of fluoro-carbons usually known as Freon. Unfortunately the same chemical inertness that makes it safe for electronic applications (non-flammable, low toxicity) also makes it linger in the atmosphere for years before reacting to harmless products. During this time, it can interact with the UV-ozone reactions in the upper atmosphere.

There are other chemicals with similar boiling points to CCl2F2 that might be used as refrigerants in closed systems such as ammonia, sulfur dioxide, propane, and butane. All of these, however, have severe problems with toxicity, reactivity, or flammability. Liquid carbon dioxide, as in the CO2 fire extinguishers, might be a good choice but high pressures and extremely low temperatures are involved. None of these materials are suitable as direct replacements for Freon-12 in freeze sprays.

The best solution I can suggest is to use a voxtex cooler. These units run on compressed air, needing several cubic feet a minute at 50 to 100 psi. They produce a stream of cold air at one end and a larger stream of hot air at the other. Several companies make these units specifically for the purpose you describe. One comapny that comes to mind is Vortec corporation; they make several units capable of reaching -40 degrees (C or F - same thing!). If you look up vortex coolers, you may find them listed as Hilsch tubes coolers.

I recently saw a DuPont advertisement for what they claimed to be
a replacement for Freon, in freeze sprays and other aerosols.
It is called Fluorinert, and supposedly doesn't damage the ozone
layer or have any other side effects. (We'll see....)
It's not an entirely new product; they've been using Fluorinert as
coolant in Cray computers for a while.

I don't know if it's on the market yet, or what DuPont's plans
are for it. But if it replaces freon, I'm certainly looking
forward to it.

36. Looking for X-10 controller manual

Newsgroup: rec.ham-radio
Date: 1989-02-03 03:27:35 UTC
From: wiz@xroads.UUCP
Message-ID: <565@xroads.UUCP>
Source record: 19560
Cross-posted to: misc.wanted,sci.electronics,rec.ham-radio

Recently I ran accross a bargain at my local SHACK. The manager offered to
sell me his last remaining G.E. Homeminder (X-10 module controller)
for $35.00 - SOLD!
I understand that R.S. was selling them on a "Special Purchase" deal for
about 1 year -- meaning G.E. sold them dirt cheap to R.S. on a one-time
deal. It's mostly menu-driven as it hooks up to your T.V. and you select
options with a remote control. I was able to get it cheap because the
only thing it did not have was the manual.
The manual is almost essential when you wish to use the remote phone menu
and be able to turn things off/on or leave a message for a house-sitter.
Please, if anyone out there has or knows of someone who owns the
GE "Homeminder", beg them to drop me a note here or the old-fashioned
U.S. Mail or by phone call;
Mike Carter

+++ THE HOSS TRADERS ANNUAL SPRING FLEA MARKET AND TAILGATE SWAPFEST +++

PLACE: Deerfield, N.H. DATE: 03 JUN. 1989(SAT)
DEALER SETUP: Anytime OPEN TO PUBLIC: All night Friday & Sat.
ADMISSION: $5.00(buyer or seller) TABLE PRICES: NO EXTRA CHARGE
TALK-IN: 146.40/147.00 or .52 REFRESHMENTS: LOTS (The usual bunch)
147.625/147.025
****
THIS YEAR IN DEERFIELD. The Hoss Traders Tailgate Swapfest (Deerfield) will be held at the Deerfield Fairgrounds, Deerfield, N.H. on 3 June 1988. All info is the same as it was before when the event was held at Deerfield before. There will be Friday night camping, but no camp fires are allowed. Use of the buildings is not permitted unless you have a receipt from the owner of the building.

NOTICE that the date is different than the usual day before Mothers day. The Fall date is now set for the Saturday after the Deerfield Fair, unless there are problems. Admission is $5.00 for sellers or buyers. The Fairground opens at 1600 on Friday.

If all goes well we will be in Deerfield on the day before Mothers Day in 1990 as usual. If Not, we will be looking again.

There will be a "special" dumpster for metal this year. The chief complaints were about unauthorized use of the buildings and campfires, if we can manage these, we will be back in Deerfield for the foreseeable future.

it probably won't go on sale. if you can wait, apply for a radio
shack credit card. don't use it (the rate on it is usurious,
anyway). eventually, they get nervous and offer you a ten percent
discount on any purchase with the card. use the card, pay it off
immediately, and wait for another good product and another coupon.

this also works for monkey wards and sears.

brian

41. Pro-2004 going on sale? (Sorry, but it isn't - read this anyway)

Newsgroup: rec.ham-radio
Date: 1989-02-06 22:50:24 UTC
From: depolo@eniac.seas.upenn.edu
Message-ID: <7706@netnews.upenn.edu>
Source record: 19565
Cross-posted to: rec.ham-radio,sci.electronics

The Pro-2004 was on sale for a few weeks last summer. Don't hold your breath for another sale. Typically Radio Shack only puts stuff on sale that aren't selling well. Unfortunately, the PRO-2004 has been doing OK at it's $430 price.

However, there is a shortcut! Grove Enterprises (the publisher of Monitoring Times, a pretty good magazine) sells it at $389, including an instruction sheet that tells you how to modify it for cellular coverage. If anybody wants the address/ordering info/telephone number for Grove, let me know and I'll find it for you.

By the way, I have a 2004 (that I bought at full price) and I love it (just a little info for those that are thinking about buying one).

I've done the following mods and anybody that is interested in how to do them can send me mail:

Cellular coverage
Turbo-Scan
400 memory channels
Carrier-detection light
Remote control (scan, manual, search up/down - other keys are just as easy to duplicate)
Tape On/Off relay (for use with the "remote" jack on a tape player to turn it on and off when a carrier is found either in search or scan mode).

Happy scanning!

I got my 2004 about a year ago when it was on sale then... It was on sale about one month after the 200 channel version. So they do go on sale.... So look for the 2004 to go on sale in the next 2-3 months I would guess...

But I have been wrong before....

I think the Pro-2004 is a heck of a good scanner. However, one problem
that it has is front-end desense. On two that I have tested, they
lost 38dB (!!!) of sensitivity when connected to a good antenna
that was letting in -15dBm of FM signals (sensitivity loss was on VHF-Hi
Band). Turning on the attenuator on the back actually improved sensitivity
by 28 dB. I have found that using the radio shack FM reject filter in
front of the scanner seems to help, but it is 75 ohm with wierd (F)
connectors, which is a bit of a kludge.

From: cyamamot@ohe2.usc.edu
Message-ID: <2625@nunki.usc.edu>
Source record: 19570
Cross-posted to: sci.electronics,rec.ham-radio

Greetings!

Does anyone have the July 1988 issue of Monitoring Times? There is an article in there about the PRO-2004 and how someone replaced the crystal on the PC3 board to increase the scan rate to 30 chan/sec. I don't need all the info that was probably presented, just what parts were changed and with what values. Especially the frequency and characteristics of the crystal (i.e. loading, parallel/serial, 2nd/3rd overtone, etc).

Also was there a Part III to the series in the Sept issue? I only have the August issue with Part II and Grove says they only have back issues of Aug/Nov/Dec 88 and Jan 89.

Any info on either Part I or Part III??? would be appreciated.
Thanks in advance!

Cliff Yamamoto
de KA6JRG

P.S. I just started my subscription on Jan 89. For those interested, Grove is backordered on the PRO-2004 until the last week of Feb. when their shipment comes in. I just ordered mine today (2/7) and they told me this. They say it is better to order now than wait till they arrive as it is FCFS (first come first serve).

You could try making a transmission line stub trap. Get a T coax connector
and put it in the antenna coax line, and connect a length of coax cut to the
equasion:
length = 2953 V where V is velocity factor (0.66)
----
f(MHz) length is in inches
for an open ended stub.
It comes out to 19.5 inches to trap out 100Mhz. Only problem is that you'll
also trap out 300 Mhz, 500 Mhz, etc.
Use 1/2 the above length if you want a shorted end stub.

There are a number of illegal short wave broadcasts that are apparently difficult to track down (as to location). These broadcasts consist entirely of numbers (as far as I have heard at least).

My question to the net (particularly to the sci.crypt experts) is simply what type of encryption schemes are employed by these "air pirates"? The one station I've recently heard (its been a while though), transmitted numbers of a fixed length of about 5 or 6 digits each (in morse code). These numbers obviously mean something to somebody :-)

I have no cipher expertise but this has me somewhat intrigued. Anybody care to shed more light on this subject?

Numbers stations may be found on several frequencies,
with both males and females speaking in many languages.
Some are in Morse Code.

They remain the subject of debate among SWLs, and
attempts by hobbyists to break the coded messages have
been unsuccessful. One prevailing theory is that they
are "spy" stations, sending orders to operatives in
foreign countries. Another theory is that they are asso-
ciated with smuggling activities, like ordering, and
arranging for drug deliveries.

I agree with the "spy" theory. Monitoring Times reported
a few years ago how an SWL traced down the source of one
numbers station. Using a Kenwood R2000 shortwave
receiver in his car, the SWL found the signals eminated
from a U.S. Government facility in Warrenton, VA, opera-
ted by an arm of the intelligence community.

The FCC won't talk much about these signals, but I bet
you dollars to donuts that the NSA, USN, CIA, etc. know
exactly what their purpose is, and monitor them (and
operate some) closely. At the very least, our government
knows the geographic locations of these transmitters.

Not all numbers stations are in the same "business." A
few of the CW stations actually identify with call let-
ters. The U.S. FEMA organization (Federal Emergency
Management Agency), operates several stations and con-
ducts periodic tests of its communications systems, which
would be pressed into service in the event of a war.
Their crypto transmissions make for good code practice.

In the past year or two _Cryptologia_ magazine had a short review
of a book on these radio stations. Apparently the book lists
their frequencies and makes some guesses as to what the stations
are about. As I recall from the review, however, no one really
seems to have a very good idea of what's going on, let alone the
specific enciphering algorithms used by these unknown persons.

These 'numbers' stations, mostly in Spanish are rumored to be signals sent to spies in foreign countries. Some of their signals have been traced to the east coast of N. America and some to Cuba or thereabouts. General opinion is that they are CIA or NSA operated but no one who really knows is talking! Others like the N. Korean on 8.030 Mgz or the Russian numbers station on 7.422 are also believed to be operated by some government for communications with operatives or to make the target country think they are!

Anyone with a broad band ham tranceiver could modify it and send out similar transmissions. The FCC knows about these spy stations and if you call to complain about them stepping on your QSO in the ham bands they will come back and tell you it was an international SW broadcaster tuning up or some sort of bullshit.

These stations have been operating for many years, some of them hourly for over 5 years. I did a computer analysis of 3 of these types of stations and found that strings of 3 or 4 letter or number pop up quite often and might signify use of a lookup pad code where for example, "1AC" can be looked up in your handy dandy copy of Popular Spy Code monthly, and find out it means "get photo of". These codes are impossible to decode because of the one to one relationship of strings to phrases.

Pop Communiations has articles on these number stations almost monthly.

It sounds like you may be describing a code, as opposed to a cipher.
Codes, especially superenciphered codes, are much more difficult to
crack than ciphers, but it's been done many times in the past. For
example, the course of both World Wars was significantly affected by
cracked codes (as well as cracked ciphers). During World War I, the
British solution of the so-called Zimmerman Telegram was a major factor
in the entry of the U.S. into the war; during World War II, the U.S.
was reading the Japanese naval code. (This is distinct from PURPLE,
the top-level Japanese machine cipher.) As usual, see Kahn for details.

Mind you, I don't know that those messages really are code, but if they
are cracking them is not impossible, especially under reasonably favorable
circumstances (probably texts, etc.)

Greetings
I'm about to purchase an antenna and was wondering what the rest of
you do to prevent or slow down corresion. Is there any particular brand of
weather sealant or coating that I should apply? Are there any particular
weak spots to check? If the antenna is engineered properly, should I even
worry?

I'm just concerned because it's a pain bringing down and putting up
antennas and after seeing the condition of them after 5 years makes me wonder
how they still work.

Thanks in advance!

I have never tried this on an antenna...but there is a stuff that comes in a blue spray can, simply named "plastic spray". (I think the company name is Zippo; can't remember, and the can is at home, 450 miles away).

The stuff is excellent for spraying on completed circuit boards, etc. to make them a little less pervious to moisture, etc. (I'd even go so far as to say it 'waterproofs', if you spray it on thick enough).

I don't see any reason you couldn't spray your antenna with something like this ... most electronics parts dealers have it. The only problems I note is: (1) dangerous fluorocarbons will deminish the ozone layer and give you skin cancer, and (2) if the stuff lands on plastic, it first softens it up, before it hardens. The plastic (or rubber) couplings between antenna elements won't look as shiny as they used to be.

Good luck. (Wish me luck on my novice test, which will hopefully be within the next 2 wks!)

Can anyone send me a schematic or info on broadband noise filters
that will filter out 60 Hz hum on the 120VAC line? Some background:
I use a portable stereo cassette recorder to record music off my
receiver. When the recorder is powered from the AC line, I can hear
lots of 60 Hz being recorded on the tape. Moving the recorder, cables,
or power cord around tends to lessen the hum. When I record using the
batteries, no hum. Also, when I playback, if I put the INPUT switch
on the recorder to the MIC position, no or very little 60 Hz hum is
heard, but when the INPUT switch is set to LINE, lots of hum. Ideas?

Thanks - Ihor

The 60 Hz "hum" on the AC line *is* the AC power. There is no way to
filter it out; if you want to run your recorder on AC, there will have
to be 60 Hz AC going into the power supply. What you need is filtering
inside your recorder, to keep that 60 Hz out of the signal-handling
sections. It's quite possible that you simply have a poorly-designed
recorder.

The one fix that wouldn't involve digging into the guts of your recorder
would be to forget using the recorder's own AC power supply, get a
separate power supply that produces the same output voltage as the
batteries, and hook that up to the recorder as a replacement for the
batteries. This isn't certain to fix the problem but it would probably
help. Radio Snack carries plug-in "bricks" of various voltages that
might do the job, although you'll probably need a bit of soldering to
connect them in.

It's gonna take a hell of a filter to get rid of that 60Hz on the 120V line!

:-)

[description of problem deleted]

OK, "60Hz hum on the 120VAC line" is all one noun. From your description,
it sounds like you've got ground loops in your setup. Make sure each piece
of equipment has only one path back to ground.

I would be grateful if anyone could supply information regarding
a TA7061AP audio processor IC used in many Kenwood FM transceivers
produced throughout the 1980s. This chip can't be more than
a few op-amps, but like so many custom ICs without
a data sheet or some detailed information, I will be reduced
to a parts-changer to get the audio sounding somewhat intelligible.

Please email any info or pointers to me and I will reward the
net community with a patch to make Kenwoods actually sound
much better on the air. You may not notice, but those of us
hearing you will, and be glad. Thanx in advance.

Put aside the 60 Hz filter idea for the moment. Rather than
poor power supply filtering, it sounds like your hum problem
may be due to:

1. a ground loop or

2. an open shield in the patch cables connecting the
recorder to the receiver.

I assume the receiver is powered by 120 VAC, although your
article didn't specify.

If it is indeed a ground loop problem, it could be solved by
breaking the ground connection at one end of each patch
cable.

Since I have to do this when connecting my monophonic
Panasonic recorder to some scanner radios, but not others, I
constructed 2 different patch cables. One cable has shield
connections at both ends, and the other cable is a shield
connection at only one end.

If, instead, the problem is an open shield, then repair or
replace the cable(s).

You really don't want to filter the 120VAC line directly. I mean,
that's what there is on the 120VAC line, 60 Hz. If you get
rid of it, you're not going to have much left to power your recorder.
Perhaps I'm reading your posting a bit too literally.

>...
>Moving the recorder, cables,
>or power cord around tends to lessen the hum.
>...
>Also, when I playback, if I put the INPUT switch

Ihor, I think you have a grounding problem. These are probably the
hardest types of system level audio problems to solve. All I can
suggest is that you try a lot of different connections until you
find one that works. The fact that the MIC input is noise free is
curious. Usually it is just the opposite. A clean MIC input would
seem to indicate that the internal power supply in the recorder is
doing a good job.

Try connecting the chassis grounds of the recorder and the receiver
together. Try reversing the polarity of the 120VAC plug at the wall,
i.e. - pull it out, turn it over, plug it back in. Try this for the
receiver, also.

I have had some good success at treating problems of this type. I
have also struggled with some that I never did solve. I've never
been able to tell exactly what the difference was. Solutions that
worked in some cases did not work in others.

Good luck,
Mike Urban

Well, thanks to everyone who responded. The two problems suggested are:

1 - a ground loop or faulty cables. Recommendations were to check the
cables and switch around the plugs at the wall or to other outlets.
I tried both of these, and this did not solve the problem. So...

2 - filtering capacitors going bad in the tape recorder's power supply
(AC to DC) conversion. This may be the problem. The recorder is
almost 15 years old. Before I go and take it apart, any ideas on
how to test the capacitors using a volts/ohms/DC amps meter to see
that they are bad? Any ideas on which type of capacitors to use
as replacements (obviously same or higher ufd value and same or
higher voltage value)

Thanks for your advice - Ihor

> higher voltage value)

If the recorder is that old (and especially if it hasn't been used much),
then the electrolytic cap. are probably dried out. It is often possible to
"re-form" the barrier, but for the price of new caps. at this voltage I would
simply replace every single one. Just the electrolytics (polarized) ones! The
others should be ok unless physically damaged somewhow.

The same or higer volt/ufd is fine, but try to stay within about +20%, since
the actual capacitance will vary some with too low a voltage and too high a
capacitance (e.g. 100X) can give you problems with leakage.

Be careful with over heating the PC board and good luck!

Rats! I was hoping someone wound mail a realy useful reply to this one. I have the same (similar?) problem when I hook up my Mac to the Stereo via the Mac's audio digitizer. Everything I playback has a terrible 60/120 hz. hum in it. Sure, the filter caps on the mac aren't the greatest, but there still good, and besides, replacing them with mega-farad caps would void the warranty. I was hoping someone would mail in the schematics so's I could build an in-line, black box trap to clip everything below 120hz.

Rats!

I have heard from two different Radio Shack sources that the
PRO-2004 will be on sale for about $300 at the end of March.

Purportedly, it will be listed as a "sold out when gone" item,
but nobody seems to be talking about a successor model.

> --Bill Davidson
>....!{ucsd|sdcsvax}!celerity!billd

Some observations, based on a bit of experience.
1) Most "Professional" or "Industrial" equipment does have a grounded plug. Might be a cost factor here.

2) I've seen schematics for some such equipment, and the design goes to some trouble to isolate the power ground from the signal ground. Power ground goes to the chassis for shock protection as usual, signal ground to the shields on the connectors. Often these two grounds are connected through a resistor, which sometimes can be shorted by rear-panel jumper.
I suppose trying both jumper positions (open/closed) is useful in fighting a hum problem, although I've never used then.

3) Much of this professional/industrial equipment uses balanced audio inputs and outputs, with 3-pin XLR connectors. If everything used transformer balanced I/O, there would not be very many cases of hum trouble.
Electronicly balanced I/O also usually solves the problem.
Unfortunatly, good transformers run $20/each and up. Electronicly balanced inputs and outputs still usually take an op-amp for an input and at least two for each output, or a bunch of discrete parts, all of which cost. Even the XLR connectors run at least $2 in medium quantities.
Here, I'm certain cost is the reason you don't see these things in "consumer" stuff.

3.5) Balanced signal interconnections are good for two reasons
A The input stage cancels the 60hz carried or induced in the ground (shield) because the input signal is taken to be the difference between the two signal wires, not the difference between one signal wire and ground.
B Such connections are usually low impedance, (like 600 ohms instead of 10K) which reduces the levels that are induced on the cables by things like inductive coupling to nearby power or signal cables.

4) I can recall one case where connecting the ground screw on an audio
mixer to the screw on a connected stereo receiver solved a low-level
hum problem. The mixer had a grounded plug, the stereo did not.
Inputs and Outputs were unbalanced.

5) Unfortunatly, video is still usually unbalanced through the BNC connector,
which can lead to visible hum and noise in the picture. For this there
are available video isolators an video transformers, that couple
the signal without allowing a direct connection on which unwanted ground
currents can flow. Unfortunatly, these are expensive.

2400HZ Crystal phase lock Weather Satellite decoder
Updated by Mike Gore March 1989
Part 1 of 3
==========

This posting is broken into 3 parts. Part 1 contains a functional
outline of the decoder and some information of interest on the NOAA and Meteor
weather satellites. Part 2 contains the decoder diagram in ascii text format.
Part 3 contains some functional test software written for the ATARI ST.
You are encouraged to extend/modify this to other machines and to
add improvements. I hereby place these postings in the public domain.
My hope is to stimulate other people to get involved and share ideas in
this in testing area.

Background:

The NOAA and Meteor weather satellites transmit images of the Earth
using an APT format [Automatic Picture Transmission]. The image information
is encoded with a 2400HZ AM audio signal that is transmitted on a FM modulated
VHF downlink. The amplitude of the 2400HZ signal represents the surface
brightness at a given instant scanned by a rotating mirror. The image format is
120 per minute for Meteor and lines per minute for NOAA. Frequencies in use
are are 137.5MHZ, 137.620MHZ for NOAA and 137.300MHZ, 137.400MHZ and
137.850MHZ for the Soviet Meteor satellites. The receiver bandwidth must be
at least 30KHZ or more for good results.

The NOAA craft transmit both visual and IR images where the Meteor
crafts only send visual band images. The resultant image is therefore the sum
total number of scans you are able to receive before the satellite drops below
your local radio horizon. There is thus no concept of vertical sync other then
indirectly by whatever range of scan line you may happen to choose when
displaying a final image.

After demodulating the 2400HZ AM signal one is only left with the
original amplitude. Beside having brightness information the demodulated
signal for NOAA satellites has a 1200HZ sync burst to flag the start of a
given scan line whereas the Meteor craft uses a 300HZ sync.

For my receiver I used a Radio Shack PRO-26 scanner but I had to
replace both ceramic IF filters. For the 455KHZ filter I use a muRata
CFM455A and for the 10.7MHZ filter I used a muRata 10.7MA. I should mention
that the CFM455A is larger the the original filter so you must lay the filter
on its side on top of the MC3361. For the 10.7MHZ filter you could use most
any 3 terminal filter used for many FM radios with around 1 to 1.5K impedance.
For best result you must adjust the preamp in the PRO-26 to recenter the

passband near 137.5MHZ. For my antenna I chose a turnstile antenna with a 2 stage FET preamp. Very useful information may be obtained from either of the 1987, 1988 or 1989 ARRL Handbook published by the American Radio Relay League. Also I would suggest the ARRL Antenna Book for anyone seriously interested in experimenting with various antennas.

Circuit description:

My demodulator uses a passband network built of 2 high and 2 low pass filters. The stop bands are currently 1200HZ and 3600HZ however this value was somewhat a matter of experiment on my part. The filter feeds a full wave active rectifier that can be balanced with a 10K variable resistor. The rectifier part is similar in form to that found in several National Linear AP Notes yet I liked the version in the 1987 ARRL handbook enough that I used theirs. What follows the full wave rectifier is a resetable integrator followed by a sample hold. The DG201 analog switches are made by GE Intersel. The op amps I used were the TL082 dual or TL084 quad op amps yet LF353's just as well.

I chose to use the resetable integrator rather then a low pass filter after a rectifying stage so as to push the overall demodulated bandwidth of the system to the limit. The results are very good, the main advantage here being that aliasing errors are virtually gone because the integration period is synced with the 2400 AM carrier. The integrator may be run at half cycle intervals but the circuit described here is wired for 1 cycle samples. In order to phase lock the system clock with the 2400HZ AM carrier I chose a Crystal VXO design for very stable operation.

In order to be able to record on tape I shaped the output of the VXO into a triangle wave in order to drive one channel of a stereo tape deck. During play back I use a simple PLL onto lock to this signal and provide timing uneffected by any residual wow and flutter. It is this last analog PLL that actually drives the switchable integrators and A/D converter timing. So that the VXO can run closed loop the analog PLL must see a copy of the shaped VXO signal during a recording session. If a tape deck is removed from circuit you just need to jumper the shaped VXO signal to the analog PLL input in order to let the VXO run closed loop.

If there is no need to record signals on tape for later play back at all you can remove the analog PLL and VXO wave shaping circuit. To do this just jumper pin 14 of the MC14020 to pin 1&2 to the 74LS164 directly and remove any left over connections from the 74HC86 XOR gate (pins 4,5 &6).

Some may wonder why I just don't use the analog PLL by it's self and skip the VXO all together. Part of my reason for not doing this is because the analog PLL is not nearly as stable nor noise immune as the VXO. Any phase errors in the system will cause amplitude errors which reduce the whole usefulness of using a switchable integrator design in the first place. Also I use the VXO to create basic timing to such accuracy that in fact I no longer even need to examine the sync information transmitted in the APT signal. The loop time of the VXO is so slow that noise does not impact the VXO much. Ok, so why not use an analog PLL with very slow loop time then ? The

answer for this is that drift is a serious problem in setting and maintaining an analog PLL whereas a crystal does not suffer from shifts in the center frequency. Remember that the loop response time for the PLL must be very slow and as the center frequency drifts the time for the loop to close increases. Lastly because a PLL is used for timing we need to restrict how far the loop frequency can actually move.

For NOAA I found with it's scans of 240 lines per minute and also with two images interleaved on alternate scans there isn't much bandwidth left over for image detail. This need for maximal bandwidth led me to choose the VXO design after much experimentation. I should note that the Meteor satellites run their carrier slightly off 2400HZ and my system can not phase lock on their carrier - in fact there doesn't seem to be a strict 1 to 1 relationship between carrier frequency and scan rate as is the case with NOAA. The loss of lock still gives very good images but not as good as they could be. I should mention that when the VXO loses lock it stays near it's center frequency so it remains useful for timing to a very high degree of accuracy. Regardless of the carrier differences the scan rate for both satellites is *very* accurate - enough so that one doesn't even need to use the sync information to maintain sync. In fact in the final data collection software I chose not to use the sync burst in favor of a manual software offset adjustment in the final display program.

The VXO uses a standard XOR phase comparator for locking yet there is no loop filter needed by design. It works out that the phase jitter is to small to even worry about with only an 8bit A/D. Basically the XOR gate forces the 2400 divided reference clock to be roughly 90 degrees out of phase with the downlink 2400HZ carrier. The crystal I used is series tuned such that when the analog switch closes the frequency runs low and when it is open it runs high. The 20pf cap across the switch adds to the switch capacitance to give a minimal value to keep the oscillator stable. The idea is to weight the two values of frequency with the switch open and then closed such that it averages to 2457600 MHZ with about +/- 150HZ swing when switched. The swing must at least be in excess of the worst case doppler shift - the higher the value the faster the lock yet with a chance of larger phase errors as a function of noise. This circuit works very well at locking on a signal almost totally lost in noise much unlike what one would expect with a simple analog PLL. Of course a noisy signal is of no real value yet even noise bursts can cause loss of sync with a normal non VXO analog PLL design. Also any phase errors that can occur will cause aliasing errors in the recovered amplitude at a rate determined by the loop lock time.

Software:

The code included was complied under Mark Williams C 3.0.9 on the ST.
It works in both Mono or Color modes.

The data collection program takes 1 argument which is simply the file name to save the collected data with. This program displays a digital scope style profile of the signal as it's being saved to disk along with the current line count. You may stop and close the file at any time by typing any character. The program will also stop and close its files if any kind

of write error occurs [such as a full disk and so on].

Example: get afile

The display program takes 4 arguments.

Example: disp afile 100 900 -hs2

Argument 1 is the file name, 2 is the line count to skip when reading
the file, 3 is the image offset and 4 is a a list of flags.

Flags:
c - contrast enhance
h - histogram equalize
s - flip image
y - correct aspect ratio of NOAA images
2 - magnify 2x
3 - magnify 3x
4 - magnify 4x
Notes:
You can not use both "c" & "h" at the same time.

Example: disp afile 100 900 -hs2

Credits

Many thanks go to Alan Paeth for letting me use a well tuned version
of the Floyd error diffusion method he implimented for his IM Raster Toolkit.
It provied a main basis for my final monochrome display driver.

72. Ham keyer and the Mac ADB

Newsgroup: rec.ham-radio
Date: 1989-03-06 02:10:52 UTC
From: kingdon@cunixc.cc.columbia.edu
Message-ID: <1264@cunixc.cc.columbia.edu>
Source record: 19396
Cross-posted to: comp.sys.mac,rec.ham-radio

hook it up via the ADB of a Mac SE so when I key down it triggers a "click"
for a MouseEvent. I will then use Telegraph DA to help me with learning morse
code on a "real" keyer instead of the mouse.
Does anyone think there is more circutry than merely the switch
involved in this project. I can get the pinouts from Apple Tech notes, but I
am not familiar with the Apple ADB enough to know if there is some need for a
resistor or IC somewhere.
Please email your response to me.
Thanks in advance
John Kingdon

My only question is What makes it illegal???

Just because you don't understand it doesn't make it illegal.

As a communicator in the ARMY (for more years than I care to count) I sent
thousands of messages that consisted of code groups. I certainly hope
what I was doing wasn't illegal. :-)

74. Microwave oven as transmitter

Newsgroup: rec.ham-radio
Date: 1989-03-11 01:26:54 UTC
From: mbutts@mntgfx.mentor.com
Message-ID: <1989Mar10.172656.4351@mntgfx.mentor.com>
Source record: 19398
Cross-posted to: rec.ham-radio,sci.electronics

The March 1989 _RF Design_ has an article called "A Microwave Oven
to Amateur TV Transmitter Conversion". No, he's not kidding.
It's a microwave oven with the magnetron cathode current modulated
by a pair of 6JE6s, a power FET and an opamp, producing 250 watts of
FM video in the amateur 2.39-2.45 GHz band. A modified MDS TV
downconverter (like terrestrial HBO receivers) or modified TVRO unit
is used to receive. The modulator sits where the food used to go.

Obviously not one to fool around with if you don't know what you're
doing, plus a microwave spectrum analyzer appears to be necessary,
but it is the most original project I've seen in awhile.

>separate power supply that produces the same output voltage as the
>batteries, and hook that up to the recorder as a replacement for the
>batteries. This isn't certain to fix the problem but it would probably
>help. Radio Snack carries plug-in "bricks" of various voltages that
>might do the job, although you'll probably need a bit of soldering to
>connect them in.

Unfortunately, most of the Radio Shack bricks (and those of other
manufacturers) do not put out pure DC. It's AC that has been
full-wave rectified and filtered somewhat, but there's still 120 Hz
hum sitting on the DC voltage. Thus, you may find that you get hum
with a "brick" when you don't with real batteries.

If hum persists with a "brick", you can entirely eliminate the hum from
the DC power supply by starting with a brick whose output is 3V or more
above the voltage you need, and using a monolithic voltage regulator like a
78XX or LM317 to drop the voltage to what the recorder needs.

76. Need FM Transmitter Ideas

Newsgroup: rec.ham-radio
Date: 1989-03-13 17:58:24 UTC
From: stever@wjvax.UUCP
Message-ID: <1515@wjvax.UUCP>

I need to buy or build a low power FM transmitter which will work on the standard 88-108 MHz FM band. I remember seeing wireless microphones that do this, and while in Japan I actually saw a watch with a 78 MHz transmitter built in.

The unit must transmit a signal with sufficient power to be received on a standard FM radio with a range of about 100 feet. The signal source will be standard audio from a tape recorder.

Has anyone seen such a device? If not, any ideas where I can find a circuit? What is the FCC limit on output power of such devices?

Please reply by email as I'm not a regular reader of these groups.

Thanks in advance.

I am working on a project and I need help on receiving the GOES WEFAX satellite signal. I am trying to find any equipment that will help me receive and process the signal. I cannot find any company that makes equipment that works in the 1691 MHz range. If anyone can help me, can you please reply asap.

Thank you.

GOES antenna, PREAMP, 1691 to 137.50MHZ down converter are all available
from: Spectrum Internation, Inc., P.O. Box 1084S, Concord, MA 01742.
Phone (508)-263-2145. Expect to pay about $700.00 for it.

Software: Elmer W. Schwittek, 2347 Coach House Lane, Naples, FLA 33942.
Phone (813)-434-2268. About $45~50 for a decent scan coverter pkg.
for IBM PC compatibles. Also, he includes some filter and A/D prints.

I can not say anything about SI, have not used them (saw ad in '73 mag.).
Elmer's software works pretty good. You'll also WANT to get a 'gray scale'
monitor. There is quite a difference from looking at a mush of colors and
16 gray scales for your images...

Hope this helps.
(I posted rather than replying, others might be interested.)

Universal Shortwave in Reynoldsburg, OH, sells a realy nice FAX (AM/FM) decoder that uses 9 and 24 pin Epson compatible printers for display. It is the Info-Tech M-800v2 from DES (Digital Electronic Systems ?) out of Florida. I have one of the units and am VERY pleased with the results. The unit costs somwhere between $300-$400. The unit has auto START/STOP, speeds of 60, 90, 120, 240 lpms, frame sizes of 288 & 576 IOCs, both line (B/W) and grey scale (16-shades) formats, and negative or positive picture polarity. It supports FM Fax for shortwave and AM Fax for satellites.

One thing about the M-800 is the clarity of detail it gives maps in the LINE mode. Of course, when you use the grey scale mode to get the grey-scale shading, you lose some of the clarity of the object, but the detail is still impressive.

The nicest thing about the M-800 is how cheap it is to operate. I have a WeatherFax RJ-4 (old) carbon transfer FAX machine I bought surplus, and the paper and carbon for it tweren't cheap! With the M-800, I just pipe the audio from my Yaesu to it and hook it up to my 24-pin Sekoshia (parallel interface) and away she goes. I reink my ribbons every now and then, so about I the only operating costs (visible) is electricity and paper.

You can reach Universal at: 1-614-866-4267. Their address is 1280 Aida Drive, Reynoldsburg, OH, 43068. Ask for Fred Osterman as he is the guru on this stuff. NOTE: I am *NOT* associated with Universal in any way other than I love the product and am a very satisfied customer!

Hope this helps.

Mark.

Does anyone have a schematic for a US Army Signal Corps "Radio Receiver BC-348-N". I recently tried to replace the CW Osc. on/off switch, but I am not entirely sure that I've got it wired back together properly (never, ever lose your notes if you have more than two wires to join..).

A second problem I have is the possibility that a tube is burned out. The tube is labelled "VT-233 KEN-RAD Inc"; the VT-117 tubes are helpfully subtitled 6SK7, but not this one. Anyone with ideas on identifying it?

83. Problems with TM-721 dual bander

Newsgroup: rec.ham-radio
Date: 1989-03-17 20:57:01 UTC
From: 31002_1650@uwovax.uwo.ca
Message-ID: <1893@uwovax.uwo.ca>
Source record: 19407

In the last few weeks, members of our local radio group have purchased quite a bit of new ham radio gear mau(sp)manufactured by Kenwood. Out of 5 TM-721 dual band mobiled()s purchased, 3 were DOA and returned to the dealer for repair as he was unwilling to refund DOA equipment only have it repaired.

Also, a TM-790 was UHF dead on arrival. Have many members of this net experienced problems with the TM-721 radio. It is an EXCELLENT radio and the ones that are working are loved by thier owners. We an not used to QA problems with our Kenwood equipment but when one sep(SP)spends 5K on radio gear, imports it into Canada and finds it dead, and has to wait one month to get the gear back, it makes you want to look at other manufacturers.

P.S. excuse the spelling and grammer, no backspace on the computer.

In article <4947@mnetor.UUCP>, jim@mnetor.UUCP (Jim Stewart) writes
about the PRO-2004 scanner:

>I have also seen comments from some people suggesting that certain
>mod's aren't all they are cracked up to be. The LED indication (...
>...) when a carrier has been detected, is one that comes
>to mind--I don't have the info and I've heard that it doesn't work
>for all modes.
>
>Comments from Bob Parnass?

You read a confused combination of two comments.

I posted that the modification mentioned in Monitoring Times for
adding an S-meter to the PRO-2004 would only work in WBFM mode,
so was of marginal utility.

On the other hand, my carrier operated LED modification which works well
and makes my PRO-2004 easier to use.

Hope this clears up the confusion.

86. SpaceNews 20Mar89 <SPC90320>

Newsgroup: rec.ham-radio
Date: 1989-03-19 02:53:26 UTC
From: kd2bd@ka2qhd.UUCP
Message-ID: <815@ka2qhd.UUCP>
Source record: 19410

Bulletin ID: SPC90320

SpaceNews

MONDAY MARCH 20, 1989

SpaceNews originates at KD2BD in Wall Township, NJ, and is available on packet radio bulletin board stations across the North America and around the world on the MTTBS telephone BBS at (201) 494-3649, the Unix USENET News Network, and also on WangNet.

* SHUTTLE NEWS *

An estimated crowd of 450,000 people were at Edwards AFB, California on Saturday to watch U.S. Space Shuttle DISCOVERY safely land after one the most trouble free shuttle missions to date.

ATLANTIS will be rolled out to the launch pad at the Kennedy Space Center, Florida on Wednesday for the next shuttle mission, scheduled for April 28th. The April mission will deploy the "Magellan" Venus probe from the shuttle's cargo bay. There are six more shuttle flights scheduled for this year.

* OSCAR-9 NEWS *

All four HF beacons on OSCAR-9 have been switched on and are transmitting telemetry in 12 wpm morse code. The frequencies are 7.002, 14.002, 21.002 and 29.510 MHz. Interesting propagation effects can be noted when monitoring more than one beacon simultaneously.

On Thursdays (UTC), the VHF beacon will transmit telemetry in plain english using its Digitalker. The telemetry channels to be transmitted include:

08 : Battery Pack A Temperature (C)
09 : Spacecraft +X Facet Temperature (C)
17 : Magnetometer Experiment -Hz Fine
18 : Battery Pack B Temperature (C)
19 : Spacecraft -X Facet Temperature (C)
27 : Telecommand Receiver Current (mA)
28 : Radiation Experiment Temperature (C)
29 : Spacecraft -Y Facet Temperature (C)

The VHF beacon transmits on 145.825 MHz FM with 300 mW of transmitter power. The HF CW/A0 beacons run 100 mW each.

* WEBERSAT NEWS *

The primary payload aboard WEBERSAT is an experimental low resolution TV module. The TV module is a collection of experiments designed and built by students from the Center for Aerospace Technology at Weber State College in Ogden, Utah.

The experiments are:

1. A standard miniature CCD color TV camera modified to operate in a vacuum.

2. A spectrometer sensitive from 300 microns to 1100 microns.

3. A 1265 MHz ATV receiver.

The data generated by each of the three experiments are digitized and loaded into the bank-switched 2 Megabyte memory area of the computer. The digitizer sampling rate can be varied from 2.4 Khz to 10 MHz.

The TV Camera Experiment

The TV camera is a Sony Ci-10 product. It produces a standard color NTSC analog waveform which is digitized at a sampling rate of 10 MHz. The CCD element in the camera has a resolution of 780 X 490. It is estimated that when the camera is pointing towards the Earth, pictures will be taken of a ground area about 350 km X 350 km with the lens to be used.

The digitized television frame includes all synchronization signals, color burst and chrominance information. The picture is compressed, archived and stored in the 8 Megabyte area of computer memory. Pictures will be downlinked in compressed form. Software will be made available for the display of these pictures.

The camera will point out of a side of the spacecraft (perpendicular to the Z axis). Given the expected tumble and spin of the satellite, this arrangement provides the maximum view of the Earth. Positioned next to and on either side of the lens are two small photocells which will act as horizon crossing sensors. They will be designed for a narrow field of view and will be pointed so that their view fields do not overlap. When both sensors are illuminated at the same time, that side of the spacecraft faces the earth (about 135 degrees wide at that altitude).

The Spectrometer Experiment

The spectrometer experiment is designed to provide the spacecraft with sensing capability to offer substantial educational potential in the field of physics. Spectral reflection from the earth's atmosphere at various latitudes and longitudes is

characterized by frequencies of absorption. Spectrometer data
can be used to determine atmospheric components within the field
of view of the device.

The spectrometer will also point out of a side of the spacecraft
at 90 degrees to the TV camera. Two additional horizon sensors
will be located on the side of the spacecraft adjacent to
the spectrometer. They will be employed to sense the Earth in a
manner identical to that described above for the TV camera
sensors.

The 1265 MHz ATV Receiver

The 1265 MHz ATV receiver experiment is designed to study the
value of store-and-forward capability as it applies to pictures.

The 1265 MHz ATV receiver will receive a picture uplinked in the
amateur satellite 23 cm band. The picture will be digitized and
because the designed experiment is designed for the NTSC TV
format, the requirements for storage and handling of the
digitized data on the spacecraft are identical to those of the
camera.

I got a lot of requests for this program (again), so I'd like to post it here. Lots of credit to Jay, its author :-)

There are three parts. To take it apart, you must have uudecode and one of the IBM standard archive utilities (for example, pkarc, or the like) -- both of these are available on the net.

1> remove the headers of the message, and the part that says "REMOVE THIS LINE" at the very beginning and end of each of the 3 files
2> combine the three files into one, single file, and call it "morse24c.uue" or something like that.
3> uudecode the file. If you are on a unix machine, e.g., type "uudecode < morse24c.uue"
4> take apart the archive with (for example) "arc x morse24c.uue"

You will then have the following files:

```
Name Length Date
============ ======== =========
MORSE.CFG 41 18 Mar 89
MORSE.DOC 19231 18 Mar 89
MORSE.EXE 75024 18 Mar 89
MORSE.TXT 222 18 Mar 89
SAMPLE.QSO 333 18 Mar 89
==== ========
Total 5 94851
```

This program WORKS! Everybody who is complaining about a crummy 5wpm: it's not that big a deal, if you stop TALKING about it and DO it!!! :-)

/Chris

89. Looking for R5000 computer interface specs

Does anyone have any information on the computer interface for the
Kenwood R5000?
I just bought the R5000 and am looking for information on building the
computer interface (instead of buying Kenwood's). I have an old Usenet post
on the TS-440 computer interface, and would like to know if there is any
difference in the interface design. This post is not too specific with regard
to the actual construction, so if anyone has a good description of what is
involved I would appreciate it.

Thanks in advance,
John Kingdon

> I see no objection to a no-code license for operation above 100MHz.

Mostly I've heard the cutoff is at 30 Mhz or 50 Mhz. That issue did not
affect any ham band so was moot. I actually have read that the cutoff is
50 Mhz. Now that you state 100 Mhz, this affects 1 or 2 ham bands, namely
the 6 meter band, and your wonderful 4 meter band.

Can you check the memory banks for a parity error, CRC fault, or whatever?
I believe this figure is 50 Mhz, but have not been able to confirm the
sources I once had. Suppose you find out that the cutoff really is 30 Mhz
or 50 Mhz. Would your support for operation above that cutoff by someone
not tested in Morse Code be continued? Do British Amateur Radio regulations
define 6 meters and 4 meters as HF bands?

> My view is that a test in Morse at less than 10 wpm and/or which does not tes

What is the "spirit" anyway? Is it to assure that all hams communicating
internationally will be able to understand each other? Or is it to make
sure that the "riff-raff" stays out?

[From the January 1989 issue of the "USSR High Frequency Broadcasting Newsletter." Published every few months, 8 issues cost $4 for subscribers in North America, $5 overseas. Order from: Roger Legge, Box 214A, Etlan, VA 22719 USA.]

A HIGH FREQUENCY BROADCASTING MANIFESTO

by Roger Legge

The December 1 ending of the remaining jamming by the USSR (of Radio Liberty, Radio Free Europe, Deutsche Welle Russian, and Israel) was an important event in the history of high frequency broadcasting.

Once can hope that this may lead to doing something about the chaotic overcrowded mess of the high frequency broadcasting bands.

It should be obvious that the two biggest users of HFBC frequency space are already using far more than their share of the world's HFBC frequency space. These are: #1 - the USSR, and #2 - the USA (including government and the expanding non-government broadcasters, mainly religious, from the US and also from many overseas locations.)

Now that the jamming is off Radio Liberty and Radio Free Europe (except for moderate local jamming on Bulgarian), it should be possible for RFE/RL to reduce the number of frequencies per program and make some of the 25 250kw transmitters in Portugal and Spain available to VOA, rather than VOA's having to spend $100+ million dollars and several years to replace the low power World-War-II-vintage transmitters at Tangier.

Also, since the Cold War appears to be over (according to Margaret Thatcher), is there any necessity of continuing Radio Liberty?

The recent ending of AFRTS HF broadcasts was a step in the right direction, but the continued expansion of WYFR (now 13 transmitters and still growing) is a step in the opposite direction.

Since the USA and USSR have already agreed on reduction in some fields, it is to be hoped that they may be able to agree to a mutual reduction of HFBC frequency usage, so that other countries of the world, particularly small countries without relay stations, will have a better opportunity of their broadcasts being heard satisfactorily.

It is time for the world's International Broadcasting stations (and IFRB) to start paying more attention to QUALITY (of programs and reception) rather than QUANTITY.

The governments (and religions) of the world need to face up to reality and recognize that there is a limit to the transmitter capacity of the HFBC

bands, just as there is a limit to the people capacity of our earth, both of which have already been exceeded.

Rod Stafford (on the ARRL committee considering the nocode issue)
spoke at our club meeting last Friday. Rod said that the committee,
after last week's meeting, would likely recommend (in July?) some
form of no-code license (likely Tech written with Tech privs on 220 and up).
At least one vocal member of our club was upset by the fact that two
fifths of that committee are manufacturers having an interest in anything to
increase their business. (just reporting the facts as I heard them, not
as I believe them)

Subject: 'Stick' antennas.

In V89 $212 Chris N0JCF asks about commercial 'stick' antennas.
These are of several types depending on frequency, viz:-

1) Coaxial dipole - a halfwave dipole made of large bore tube and
having the feedline fed up the centre of the lower tube.

2) End-fed half-wave (halfwave element with a matching transformer at the
base)

3) Coaxial-Collinear (CoCo) antenna.

The coaxial dipole is the easiest to make - use metal tube (copper water
pipe, or ali antenna tube), cut two quarter-wave elements (19 inches
for 2 meters) then feed a length of coax up the end of one element. Join the
braid to the top of the element, the inner to the bottom of the other
element, then place the two elements so the ends with the coax are
about half an inch apart, and encapsulate the joint in epoxy resin (i used
a short length of plastic pipe around the joint - remember this is a RF
current node so you can be permissive with dielectrics!) and 'potted' the
joint for six inches or so). Stick it up on a stub mast and there you are.

End-fed vertical 1/2 wave - yes quite good - needs NO radials (in theory, in
practice too!). get a 1/2 wave element. Its end-impedance will be between
500 and 5000 ohms depending on its length/thickness ratio
(thicker element=lower impedance). Design a matching transformer to match
this to your 50-ohm coax, and there you are.

Coaxial Collinear (CoCo) antennas - cant quite remember the structure
of these but basically it is n quarter (or half) wave elements in
series, each separated by a phasing section that is linear (not folded or
coiled). They work very well (give fabulous local-area coverage, which is
what the commercial boys are after).

If you cant use Ringos etc as a result of phasing stub, then i would suggest
you start with a coaxial dipole - get it good and high, forget all you
have ever been told about baluns, and have a go!

The radio that you want is the ICOM 03at. The prices on these radios
have been reduced in the last few months to the $269.00 range. They WERE
$369.00 ! It is far and above a better radio than it's little brother,
the 3at. The 03 has a metal case, 10 memories, memory scan, built in
PL (CG, Quiet Channel, CTCSS), and can do vox. The only minor bad point
is that it can be a battery eater. The BP-3 that comes with it is only
adequate for light to medium usage. I would suggest you check into buying
a extra larger capacity battery pack such as a BP-5, 7, or 8, and the
BC-35 rapid base charger. Some of the after market battery packs such
as the Periphix (sp?) may provide you with more battery capacity for the
buck. Good luck,
73

> Any ideas??????

I've discovered that 3-syllable phonetics cut through the hash much better
than the "normal" 2-syllable ones.

During Field Day last year, I had the opportunity to operate the 40m phone
station of K2ZO - "Kilowatt Number Two Zanzibar Ontario". No problems.
Then again, your point seems to be that you have trouble with DX stations...

How about:
"Kilowatt Bravo Number Three TOMORROW Sierra"?

Otherwise, find out what the foreign language phonetics are for the country
you are working. For example, I've gotten great results with Spanish speaking
countries by using "Novembre Numero Dos Francia Yucatan Espania".
The extra effort could be worth it in the long run.

73 and good DX,
Andy

copied from packet, info is a little old, but still interesting. WA2ISE
Msg# TSP Size Read To @ BBS From Date/Time
26175 BN 2907 3 ALL VE7DIE 8903/0230
Subject: BIG SOLAR FLARE PROBLEMS !!

Hello All
This was taken from the TIMES-Colonist, Monday March 13/89

Three more large solar flares, each with the potential to disrupt radio transmissions and trigger aurora borealis, have erupted on the sun in a wake of unusually large blast, US researches said. A flare 36 times the size of the earth that occured Thursday on the sun's NorthEast quadrant was possibly the largest ever recorded, researchers at Holloman Air Force Base in New Mexico said. Staff Sgt. Leroy Kirkegard said the huge eruption of gas from the surface of the sun was followed by another large explosion Friday morning and three more Saturday. He said the flare Thursday measured a 4-brilliant rating, while the blast Friday measured a 3-brilliant. Flares big enough to disrupt radio transmissions are rated by astronomers from zero-brilliant to 4-brilliant. The three blasts that occured Saturday, also in the northeast quadrant, each rated 2-brilliant, he said. "That is uncommon - to have that many big flares in the same region in the same day." Kirkegard said.
....The violent eruptions created the potential to disrupt long-range communications on Earth such as short-wave transmissions and satellite links, reasearchers said. Folkers said ultraviolet radiation and X-Rays hit the Earth's upper atmosphere at noon Thursday, just eight minutes after the solar blast.
...Slower moving particles are expected to pelt the outer atmosphere for days as a result of Thursday's flare, he said.

The result on HF packet has been quite pronounced, as of today, there have been no HF stations connected or heard on this BBS on 3610. Also, at 1700 PST, I tuned in the shortwave radio and failed to locate WWV on 5,10,15 or 20 MHz. The strongest Shortwave station was the Voice of America on 11.740 MHz, with the predicted absence of any other shortwave stations on all other bands. So if you are sending a message to Toronto, or expecting a reply via HF, it will be a few days before things return to normal. 73 - watch for openings up in the 50 MHz/144 MHz freqs.

> Notarius) writes:
>> Which is why I'm holding out for a 1x2.
>
> After you specially requested your old novice call back, too. Can't be
> satisfied, can you? :-)

the answer is: When I got my ex-Novice call back, I held a Tech. Tech's aren't eligible for 1x2's anymore, and in fact I don't think that they ever were. And in reality, if I picked up a 1x2 today (which in all seriousness I probably wouldn't) it would be as a secondary call, if that every comes back into being, as I am not going to drop this callsign.

Actually, I was refering to all the 2x1's you see on the air anymore. I'm oldfashioned, thus I'm holding out for a 1x2. Get it? I didn't think you did before...

109. Police Lasers...?

If the police switch in large numbers to an IR laser system, well, let's
be prepared. Radio shack has a little module with an IR phototransistor
and (I seem to recall) a circuit for discriminating a 40KHz carrier.
Add a few LEDs, a 555 and a speaker and there's your $10 state-of-the-art
laser detector. Okay, so maybe you'll have to tweak the module a bit
to get the right frequency....:)

> >CW is an effective way to QSO with hams that don't speak English.
> Why is this? Have you ever thought about it?
Not to be confused with any of the original posters, nor to be confused with the no-code debate. Albeit, I'm sure bdale's response is a no-code anti CW comment. I am for no-code, but not CW bashing.

Yes, because CW literally requires a set of short hand notations. One, the Q codes, is shared with phone. The remaining notations are taken from many lanquages (eg `de' from french) that are NOW universally understood regardless of the native language of an amateur. Many others, unfortunately, are taken from specific languages and are only used in the conversations between amateurs using the same language (eg. cuagn). However, many of the short hand notations ARE accepted internationally and are NOT used with phone. These form the `effective' QSO with non english speaking HAMs.

Unfortuneatly, I havn't had one of these international QSO's yet, I havn't even got off the continent yet. But, I have overheard phone and CW international QSO's and found that the CW QSO's work, while phone QSO's only get going if there is a common language between them. Recently heard a phone QSO between a Soviet and an Edmontonian (City of Champions) in Russian. After it was finished an `American' tried his hand at it totally in English, No information exchanged hands because they both just repeated eachother until frustration kicked in :-(.

If it is of any interest to you, I am planning on publishing
plans of my 1200 MHz transverter for SSB/DSY and AO-13 operation
sometime later this year. For hints as to its construction see
Ham Radio Mag. Feb/Jun/Oct 1988 issues. It is basically a
20W linear transverter which can be used with either 20-30 MHz or
2M i-f.
I also have some 900 MHz hardware in queue which uses inexpensive
Japanese personal radio band components. These will be slightly less
power and class C, not linear, but quite inexpensive.
The 1200 MHz stuff probably won't get published until at least
late summer.

Probably the best source for this type of equipment is:

Transverters Unlimited
Box 6286, Station A
Toronto, Ontario M5W 1P3

Which is a company run by Hans Peters, VE3CRU. They
sell SSB Electronics equipment, which is manufactured in Germany.

Two models which come to mind are the LT-23S (1296 transverter)
and LT-33S (902 transverter). Both of these units are designed
for 144 MHz IF, but for an extra charge, can be re-crystalled
and tweaked to work with 28 MHz IFs. They both run about 10 Watts
output and both advertise better than a 1dB Noise Figure on receive.

SSB also makes transverters for 2304 and 10368 MHz. Quite good stuff.

You can call Hans in the evenings at (416)759-5562 and get price
and availability.

You could also "roll your own" pretty easily- with the mixer modules
available from Mini-Circuits and Avantek/ Mini-Circuits MMIC's,
you could get a homebrew unit operational without a lot of trouble.
The most expensive part would probably be the LO crystal, and if you
were careful, you could probably build the whole thing "dead-bug"
style.

BTW, Down East Microwave, which is run by Bill Olson- W3HQT/1 is
a good source for antennas (specifically loop yagis) and solid-
state amps for these bands. You can write him at:

Down East Microwave
Box 2310 RR 1
Troy, ME 04987

or call Bill at: (207)948-3741.

If you talk to either of these guys, you'll be pleased with their helpfulness. Also, tell them I said "hi".

Hope this helps, look forward to having you join us on 902/3 and 1296.

73 Dave Hallidy KD5RO

I'm sorry if it came across as a flame. It certainly wasn't intended that way. See the smiley? Just a gentle razz. Honest. No rancor intended. I nearly got to be WN5ENR for all eternity...

>Now, regarding the following post from you:
>>> Which is why I'm holding out for a 1x2.
>> After you specially requested your old novice call back, too. Can't be
>> satisfied, can you? :-)
^^^
>the answer is: When I got my ex-Novice call back, I held a Tech. Tech's aren't
>eligible for 1x2's anymore, and in fact I don't think that they ever were. And
>in reality, if I picked up a 1x2 today (which in all seriousness I probably
>wouldn't) it would be as a secondary call, if that every comes back into being,
>as I am not going to drop this callsign.

OK, OK. I understand. I wasn't out to push a button. I know a fairly large number of people who will keep their calls until they drop dead (or until those wonderful folks in Gettysburg screw up).

Further, I know that anyone running around with a WN call had to have requested it. Just pulling your chain, gently. No insult intended.

>Actually, I was refering to all the 2x1's you see on the air anymore. I'm
>oldfashioned, thus I'm holding out for a 1x2. Get it? I didn't think you did
>before...

...and that's the reason a lot of folks I know personally are keeping their old calls. I consider myself fortunate to have gotten mine when I did. Not necessarily foresighted, just fortunate.

No hard feelings?

And light being trully line of sight, when your $10.00 detector goes
off, it means that the fuzz have just measured your speed and are starting
to write the ticket.

Then of course that was the way it was with the handheld K band guns
too. They didn't emit until they had a car within sight, usually your car.
Kinda makes you long for the old monster X band units that they set up on
the side of the road.

Yours

I want to get in touch via e-mail with all shortwave listeners who have experience in the VLF band, especially with receiving the OMEGA navigation stations. I also want to contact those who have experience with either the Palomar Engineers VLF Converter or the one produced by Burham Electronics in Athens, Ohio. Please e-mail direct to me instead of posting.

I was refering to the laser emission level, which I believe must
have approval from the FDA or some such agency, in respect to
possible eye damage. It doesn't take a very high emission level
to be considered harmful to the human eye.

>In article <2540@splut.UUCP> jay@splut.UUCP (Jay "you ignorant splut!" Maynard) writes:
>>Almost. We'll lose our bands unless either 1) we get several million new
>>hams, or 2) we convince the FCC that nuking ham radio is a Bad Thing. To
>>me, 2) is the much better option.
>>The FCC represents, in the final analysis, the citizenry of the United
>>States as a whole. WE are the boss. The problems in government to day is
>>that the bureaucrats have forgotten who they work for.
>Uh, who's WE? The FCC, you see, represents a LOT of interests.
>[...] Lots of interests are competiting for frequencies.
>Why should hams be treated better than the others? We've been
>getting a free ride over the past years, compared to the crunching
>going on in other services!

This question is the same one as I indirectly asked above: Why is nuking ham radio a Bad Thing? As much as I said last week about technonerds, they have helped - and will continue to help - in the exemplary record of technical innovation that ham radio is noted for. We have also established a long, distinguished record in getting emergency and public servise communications through when all else fails. Ham radio is good public policy. The Commission has forgotten that, as the 220 example shows. Congress reminded them of it, albeit a bit too gently for my taste, last year. A stronger reminder is needed.

>It's gratuitous govt.-bashing to simply claim that bureaucrats
>dont remeber who they work for. To be sure, the current FCC is
>worse than most -- they think they work for AT&T, for one thing,
>and not for the customers (separate topic not for r.hr, please!)
>-- but ham radio is WAY LOW on their interest list. No bucks.

It may be gratuitous government-bashing, but it is in step with the last three Presidential elections...
Ham radio is way low on their interest list for the same reason as your AT&T complaint (on which I have no real opinion, mainly because I don't know what you're complaining about specifically - wanna enlighten me by E-mail?): they HAVE forgotten who they work for.

>>>[Fred posits a 5-10% growth rate per year until we get to the same
>>> number of hams per capita as Japan]
>>[numerical analysis deleted; summary: 1,657,000 hams, a 277% increase,
>> and 14 years to get there]
>So with your numbers, am I prepared to wait that long? YES. It's
>the fact of a positive growth rate that will make a big difference.
>New hams buy radios, creating business (jobs, tax revenue, etc.).
>A 5-10% growth rate (vs. the current negative one) will make a BIG

>difference in the competition with other services for bandwidth.

Yeah, right, uh huh, sure. Your 10% growth rate will, in the first two years, only add 92,400 hams to the population. Those numbers are miniscule to the FCC, which is interested in millions. It won't help. Ham radio must live or die based on what it does for the public. No-code will hinder what ham radio does for the public, not help it.

>"That which is ham radio" today is quite degenerate compared to what
>it was when I was a wee lad. (Which wasn't that long ago. LBJ
>was president when I got my novice.) I personally think no-code
>hams will be more interesting to talk to. And when I want to
>hunt DX, I'll still go down to 14.010 with my straight key. If
>90% of the NEW hams can't understand what I'm doing there, fine.
>90% of the OLD hams (make that 99%) don't understand what I'm
>doing on 144.91, the local TCP/IP frequency! That's a bigger problem.

Ham radio is more alive and robust than it was when I got my Novice (during Nixon's first term). HF activity hasn't dwindled; in fact, foreign hams are complaining more and more about American hams crowding them out. VHF and UHF have exploded with activity since then. "Digital communication" wasn't even thought of in those terms, and when it was done at all, was done with a Teletype.

I personally think that no-code hams will be less interesting to talk to: after all, by most of the arguments here, they're folks who are interested somewhat in ham radio, but not interested enough to meet the current requirements. I enjoy talking to people who know what they want, and go out and get it, instead of having it handed to them on a silver platter.

99% of the hams didn't understand SSB when it was being pioneered on the ham bands, either. It wasn't a problem then. Why is someone not understanding what I'm doing on 145.09 with all those funny packets such a big problem now?

>>CB also required that the operators know the rules. Look how far that
>>got them. It would take very little work for someone to get the
>>privileges proposed; they, therefore, would value them little. Why
>>should they not act like CBers? After all, they have little to lose.
>They were, for a time (are they still?), required to own a rulebook.
>They weren't tested. There was no enforcement of anything. No
>self-policing. And the system was so badly designed that it couldn't
>work "by the rules". What we're proposing, ham radio with real
>entrance exams but not code, is utterly different. That should
>be obvious, but I suppose some folks just don't get it.

Part 95 no longer requires that they own a copy of the rules. I guess that they can't expect that someone whose whole investment in a radio service is the (usually <$100) cost of the radio would follow rules that inconveniently get in the way.

My problem is that we will get that same caliber of person in ham radio if they don't have to work for it. While I have no doubt that there are many Chuq Von Rospachs, who we should welcome into the service with open arms, I have no doubt that there are many, many more who would bring the worst aspects of CB into the ham bands.

"Real entrance exams" are either subject to memorization with little work, or are so difficult that only a technonerd would be able to handle them. Only the second case is "utterly different", and it also is utterly different from ham radio as we know it.

THIS YEAR IN DEERFIELD. The Hoss Traders Tailgate Swapfest (Deerfield) will be held at the Deerfield Fairgrounds, Deerfield, N.H. on 3 June 1988. All info is the same as it was before when the event was held at Deerfield before. There will be Friday night camping, but no camp fires are allowed. Use of the buildings is not permitted unless you have a receipt from the owner of the building.

NOTICE that the date is different than the usual day before Mothers day. The Fall date is now set for the Saturday after the Deerfield Fair, unless there are problems. Admission is $5.00 for sellers or buyers. The Fairground opens at 1600 on Friday.

If all goes well we will be in Deerfield on the day before Mothers Day in 1990 as usual. If Not, we will be looking again.

There will be a "special" dumpster for metal this year. The chief complaints were about unauthorized use of the buildings and campfires, if we can manage these, we will be back in Deerfield for the foreseeable future.

| I don't quite understand what one would build. The TVRO system
| provides the audio just fine.
|
| Alan

Well "I" knew what I was asking about. 8-)

Sorry, but what I meant was something like fixing up a fixed beam or home made dish aimed at F4 with an LNB to a receiver for tuning the 70MHz LNB signal for the signal wanted. This would be for those who can't afford (don't want) a full blown TVRO system.

I have a TM-721 dual bander and the only problem that I have with the radio is the bad display... Bad in the sense that it can not be read when any amount of sun is present. At night the display looks great, but I do most of my driving in the day so I am constantly putting my hand over the display so I can read it.I even tried to build a sun shield and that did not work.

I talked to a Kenwood REP about this problem and he said... "Yes, we know..." with no solution or planned solution to the problem.

I wish I had gotten the IC-900 or the new Yeasu dual bander...

It just prys apart. Try dis-assembling the NLA or NMO connector on top
and if it comes out, push a screw driver against the base to push it
apart. If that doesn't do it, go in from an edge on the bottom with a
screw driver.

[posted mods deleted]

>There is a TURBO-Scan mod where you can up the scan speed to
>around 30ch/s by replacing the resonator crystal in step 6 with a
>10MHz version.

previously posted by <??>:
] Turbo scan for the 2004 ??? Yes !! Someone has realized that if you
] replace the present 7.37 MHz ceramic resonator CX501, with a 10.7 MHz
] ceramic resonator it really boosts the scan/search speed! The present
] resonator is soldered between pins 29 and 30 of the CPU (IC-503).
] Rumor has it that a 10.00 MHz computer xtal will work just fine.
] Note: The effect of the speed mod on weak signal performance is
] presently unknown.

The resonator is for the CPU clock oscillator. Jacque KA9FJS confirms that the mod works with an ordinary 10 MHz computer crystal ($1 at hamfest) but reports a possibly-undesirable side effect: Increasing the clock rate _decreases_ the resume-scan delay time. Jacque says: "The manual says delay is 2 seconds; with mod, delay is <1 second. Painful if a channel is filled with slow responders." He reports no detection problems at the increased scan rate.

>Also, by soldering a diode in... position D-510 (if it were labled)
>you can add 10 channels to each bank for a total of 400 ch. The
>problem with this is that then the keypad's labelling for channel
>banks becomes incorrect...

130. Kenwood RZ-1 Scanner / Receiver Info Wanted

Newsgroup: rec.ham-radio
Date: 1989-03-21 21:44:08 UTC
From: brandt@bnrmtv.UUCP
Message-ID: <5130@bnrmtv.UUCP>
Source record: 19503

On the back of this month's Popular Communications is an advertisement for the Kenwood R-5000 / R-2000 radios. In the lower left corner there is a small ad for the Kenwood RZ-1 scanner. Though the color picture of it is quite small, the radio seems to be very nice. It looks sort of like the Uniden / Bearcat 760 scanner, but of much higher quality (and performance, I hope). The ad says it has 100 channel memory, narrow and wide band FM, AM, covers 500Khz to 960Khz, several step sizes and scanning modes, backlit keys, etc. From the picture, it looks like the radio has a signal strength meter and a good-looking multi-color display. This radio looks like it *could* be an *excellent* mobile scanner.

Who sells this radio mail order? For how much? Is it any good?
Has it been reviewed anywhere? Is it better/worse than the Bearcat 760, how does it compare?

I've got the Bearcat 760 and so far it seems to be OK. It is a bit too prone to image and/or adjacent channel interference for me though...

> --
> Randy Jarrett WA4MEI

The information you need is in the Economist magazine. Issue
11-17 March Page 22. It is headlined: "Gotcha, For Now"

The article is pretty interesting and talks about radar
detectors etc, but the paragraph that is pertinent here is:

International Measurement and Control has perfected a speed detector
that uses infrared lasers, which cannot be sensed by radar-detectors.
Although the machine is ungainly and must be set up off the road (unlike
traditional radar which operates from a police car) and although it is
expensive (at $3,000, more than triple the cost of most mobile radar units),
several states are planning to test the device.

International Measurement and Control is described as a
Colorado Company.

If anyone really needs the whole article and can't get the Economist
at their local news stand or library, I will mail a photocopy.

Yours

Got the latest Radio Shack ad. On pg 18, there's the Amateur 10m rig.
A disclaimer says "You must have FCC Radio Operator's License to legally
transmit using this transciever." Somehow, this "radio operator's license"
doesn't sound specific enough to indicate that you have to have a HAM license,
not CB, marine, fire dept, etc, license. Probably noone will actually buy
this rig without realizing that you need to have the Ham license, but they
could have written the disclaimer clearer.

While in the cellular bands, press the keyboard 'RESET' switch. Should give you 30khz steps, does on mine. 'STEP' will get you back to the others.

137. S-Meters and the Regency HR-2B

Newsgroup: rec.ham-radio
Date: 1989-03-22 19:00:02 UTC
From: Michael_Edelman%Wayne-MTS@MAILGW.CC.UMICH.EDU
Message-ID: <128486@Wayne-MTS>
Source record: 19516

Just picked up a nice Regency HR-2B at a swap in Maumee, OH, and ordered a batch of crystal from JAN. Next step is to add an external S-meter. One promising idea is in K0OV & WB6UZZ's book, "Transmitter Hunting", in which they show the use of an LM 3089 chip (a monolithic IF strip). The IF is tapped off after the first IF amp and fed to the 3089, all outputs of which are ignored save the wide-dynamic range meter driver. Looks good.

However...the circuit as shown in the book has a 250 ohm resistor across the input (in series with a .01 cap) to ground. This looks like it would load the IF amp excessively if I tapped the output right off the collector of the IF amp through a .01 uf cap. Has anyone tried this scheme, or perhaps another method of attaching an S-meter to an HR-2 series rig?

My first thought was to grab the limiter voltage and buffer it through an emitter follower or op-amp circuit, but it looks to me like the limiter is all self-contained in one chip and not particularly accessable. Again, I don't have data on the chip and neither of the schematics I have match the circuit *exactly* so I'm a bit at a loss.

The idea is to use this box as my main foxhunting rig. It'll be mounted in a case together with meter, attenuator and some switching. I'd like to solicit ideas and hints from anyone with experience with this rig-or just a good idea. Responses will be summerized to the net, of course.

138. new Icom 1500 watt linear amp - info and info request

Newsgroup: rec.ham-radio
Date: 1989-03-22 19:48:50 UTC
From: kawai@csli.STANFORD.EDU
Message-ID: <8252@csli.STANFORD.EDU>
Source record: 19517

I just got a flier for an Icom linear amp, called the IC-1500. According to the flier, this is an automatic linear amp with 1500 watts continous output. I'm not quite sure what "automatic" means; the flier says, "the microprocessor control system continously adjusts the amplifier for maximum efficiency by using a sophisticated tuning algorithm in conjunction with gear-head driving motors for the bandswitch, plate and loading capacitors". The amp is made up of two components, the controller unit and the RF/power supply deck. These two components can be spaced as much as 250 feet apart. The controller unit and the RF/power supply deck are connected via serial cable.

For those of you who didn't know about this amp, I hope my posting will be of interest to you. For those who do know about this amp, please send me info regarding prices, reliability, and other user comments. I am especially interested in whether the amp automatically selects the appropriate band as the Icom antenna selectors select antennas.

The Japanese manufacturers seem to be shipping radios without a full testing of the initial runs. They are letting us test the radios for them. Sure, they fix them, but we have to wait.

I would suggest that dealers (esp. mail-order) establish a policy for sale of NEW equipment that, if it arrives DOA in full or in part, that they will trade it in for another working unit of the same model, or if none in stock, give the customer a choice of 1:wait for stock, 2:repair it, 3:buy an equivalent radio of another brand. They required getting customer approval because they would be breaking the packaging seals to do this (obviously) and the customer would not be getting that whiff of Japanese air when they open the package :-)

An alternative would be an option the customer can choose when buyoing a radio to let the dealer open the package and test the radio before actually shipping it. I recall some dealer of audio equipment having a policy like this. You could have them check the unit for operation for free, or pay a little bit extra and they would do a 48-hour burn in to make sure. If they found a defective unit, they would ship that one back to the manufacturer and start again on a new one.

Subject: Identify phone equipment?

My buddy's old building is being torn down. He's pulled out an abandoned piece of telephone equipment which used to be used with their computer. It's about the size of an external modem, has the label "Channel Interface" on the front plate, along with the bell-in-a-circle logo and the word "dataphone" next to it. Inside the plastic face plate is a bracket with two 1/4" jacks (TST and MON) labeled TRANS and two 1/4" jacks (TST and MON again) labeled REC. The bracket also has the inscription "DAS 829A-L1A Series 1." It appears to be an 829A data auxiliary set.

The back has a phone company-type Centronics-style connector (M).

Is this thing useful for anything besides stripping the parts? Is it most or part of a modem? Any part of a TNC-to-be? (Hint, hint...)

Are we even allowed to keep hold of it?--whoops, I'm not 100% sure I want to know the answer to that one...

I'm looking for a poor-man's way to get onto packet with my IBM-compatible, HT, and minimum of $.

Since summertime is rolling around again (at least here in the
Southwest :-)) I'm starting to think about mobile operations.
I would like to find a good headphone/microphone combo which I
could wear (probably the kind with one ear coverage only... I
believe two earphone types are illegal in some states). Ideally
it would consist of a "boom" mike similar to what is available
in telephone type headsets. I'd like to run VOX, and ideally
the set would have an external vox box which I could use with
a PTT circuit. Does anyone know of such a setup being commercially
marketed? I could probably come up with something that would
work, but would just as soon locate something commercial.

THANKS!

149. small 2-meter linear amp

Newsgroup: rec.ham-radio
Date: 1989-03-23 14:18:17 UTC
From: rachiele@NADC.ARPA
Message-ID: <8903231418.AA16010@NADC.ARPA>
Source record: 19434

ALINCO makes a very nice little ht amp, rated at 3 in, 30 out. I bought one new for around $65 about 3 years ago, and never had a bit of trouble with it. I use it with my 2.5 watt ft-208r, and get the rated 25 watts out. I don't know how much they go for these days.

150. AutoLog: Computer control (MS-DOS) of ICOM radios with logging

Newsgroup: rec.ham-radio
Date: 1989-03-23 14:30:36 UTC
From: rbono@necis.UUCP
Message-ID: <994@necis.UUCP>
Source record: 19432

Many have been asking me to email a copy of AutoLog to them...
I have tried.. but a LOT of mail has bounced back!

So for all of you that want it, here is how to get it:

from the SIMTEL20 server,

directory: pd1:<msdos.hamradio>

file: AUTOLOG.ARC

I am told it is available via an anonymous (sp?) ftp.

For those of you who don't know what it is...

AutoLog interfaces your computer (PC/XT/AT, or clone) to you ICOM radio
via ICOM's CI-V buss. It uses the RS-232 port of your computer, and a
TTL to RS-232 level converter (available from ICOM or you can build one
with one IC and a couple of other parts).

It allows you to control the frequency, mode, etc of the radio from the
computer keyboard, AND if you press the buttons or spin the dial on
the radio the computer keeps up with the radio.

This program does not simply turn your radio into a glorified scanner,
but integrates the radio and computer to create a "system" that works
together to help you with operation of the radio and the usual logging
that one normally does.

For example:

You tune around (using either the computer or the radio) on 20
meters and hear a DX callsign, not being an avid DXer, you type the
callsign into the computer and press a button, the computer displays
the name of the country, along with the short & long path bearings and
the distance. You turn your antenna, and call the station, press the
ENTER key to place him in the log, and the computer tell you that you
worked the station before on 15 meters, so now you can respond with
the name of the operator.

The program takes the freq/mode, etc from the radio, the time
from the computer... all you have to enter is the callsign worked and
any comments about the QSO... It allows you to search for previous calls
either by partial or complete callsigns. You can also search through the
comments for particular data... ie: search for NH to find calls that you
have worked in New Hampshire...

This program can be configured to work with most ICOM radios that
support the CI-V buss. I hope you can find it useful, I designed it to
be useful to the average ham... it is NOT intended to be a super contest,
or DX tool... but for the rest of us who can't remember the beam headings
to Japan or England :-)....

151. DFing in the VHF World

Newsgroup: rec.ham-radio
Date: 1989-03-23 15:30:04 UTC
From: jeff@virgil.UUCP
Message-ID: <1986@virgil.UUCP>
Source record: 19514
Cross-posted to: rec.ham-radio,sci.electronics

I'd like to know of any experiences (good and bad) regarding transmitter hunting. This past Sunday we had an impromptu hunt when an HT was inadvertently keyed on the local wide-area repeater.

It turns out that the HT was interfaced to a TNC and when power was turned off to the computer, the TNC keyed the transmitter (which was on a power supply). The owner knew nothing of the problem and left his QTH to run (for exercise). The HT stayed on the air (keeping the repeater down) for ~2 hours. This happened about noon.

Once we got beam headings, three of us took off looking for it. We discovered the location in about 45 minutes, but had to wait for the guy to show up. It turns out that his VHF antenna was in the attic and that he lived in an apartment complex. Fortunately (for us) he had a 10 meter dipole outside which helped in deciding what apartment door to knock on. Upon his arrival he went upstairs and shut the thing down (finals were fried by this time). He also apologized profusely. Anyway, it made for an interesting afternoon. We did all of our coordinating on 440 since the three of us had dual band rigs in the cars.

Suggestions are welcome. I'll summarize all responses to the net.

Tnx & 73,

Jeff

152. kenwood tm-721 problems

Newsgroup: rec.ham-radio
Date: 1989-03-23 16:25:00 UTC
From: MBramwel@business.uwo.CA
Message-ID: <8903231747.AA24718@julian.uwo.ca>
Source record: 19437

I have had some problems with my kenwood 721. When the rig arrived on Friday,
I quickly picked it up and drove home. 1.5 hours drive. When I connected it
up, it would not rx or tx on both bands, yet the front panel worked ok.
I opened the front panel and found solder balls rolling inside. Using a
q-tip and acohol, I was able to swab/find all the solder. Later that evening
I started chatting on 440mhz and the radio died. After 10 mins of tx-ing
the PA gets very hot and dies. I purchased the radio on Feb 10, 89.
The next day I made arrangements for its repair. The dealer would not
exchange the radio (12 hours old remember!) and insisted that it get
repaired. This dealer gets his radios repaired out of state. Last night
I made the trip for the third time back to the dealer to pick up the radio.

new problems occuring: key down and let go of the mic. The tx will continue
for 10 seconds. Note I did not hit a tone button. Simply the tx hangs.
Also the tx on 440 dies after 10 mins of use. It has been almost 6 weeks since
I laid down my cash, and I still don't have a working radio. The radio is
being sent out again today for another round.

A friend of mine bought a kenwood 790 (new sat rig), and another 721. Both rig
s have died already. The kenwood 790 was DOA and the servicing dealer has
sent it back to kenwood labs for evaluation. Note that in all cases, the custo
mer lost a radio with getting his money back, or another radio.

Has kenwood quality assurance gone to the dogs?? Try phoning them.... nice
answering machine but no one ever answers.

Kenwood if you are reading take note of these complaints... I will be ready
for you at dayton, better have the radio then!

de VE3PZR.

154. IR Radar (LIDAR)

Newsgroup: rec.ham-radio
Date: 1989-03-23 18:24:22 UTC
From: AXVSCCN@UICVMC.BITNET
Message-ID: <8903231849.AA19966@ucbvax.Berkeley.EDU>
Source record: 19436

I realize that police radar is not a ham-related subject, but since
Friday is pay day for me, I can afford to throw in two cents worth.
One of the biggest problems with police use of radar is not accuracy
of the equipment but positive identification of the offender. Instant-on
radar's have been used for several years. A skilled officer using one
can defeat *any* radar detector (assuming its used in moderation and
traffic flow speed keeps vehicles fairly far apart). Old police radar
used to be mounted along the roadside on a tripod and could clock a
fly at 1 mile (as well as roast him). When moving radar came out,
that is radar that operates in a moving patrol vehicle, it offered a
challange to speed buffs. Several years ago, a radar was developed
in Canada that could clock vehicles approaching a moving patrol vehicle
from either direction --neat trick. With so much RF bouncing around
and so many possibl reflection sources, true positive identification
of the offender has become more difficult (but not impossible). The
idea of using LIDAR is interesting. A laser light maintains a much
path than microwaves. This means that there is less chance of the
of the police officer clocking the wrong vehicle (assuming his aiming
device is accurate). The laser system is probably not as sensitive
to RFI as conventional RF radars --another point in favor of the
motorist. With both the radar and LIDAR, the police officer must
still first make a visual observation that a vehicle is speeding (which
is not that difficult to do once you've had practice), and then use
his measuring tools (radar) to obtain objective evidence. In either case,
the offender still has to be within visual range of both the officer
and the radar throughout the entire clocking to be legal. I too am
concerned about laser light damage to the eyes. I also realize that
light energy can bend and reflect --leading to possible false readings.
I just get kind of miffed everytime a new speed clocking technology
comes out and all the motorheads start complaining. If people would do
the speed limit they wouldn't have to worry about radar. If you choose
to speed, than radar and LIDAR are an occupational risk. If LIDAR turns
out to be hazardous to people's health then I'm sure you won't see it
developed much farther. Just a couple of cents worth from a guy who
has messed around with police radar for many years and who likes to
drink coffee and eat doughnuts with the local fuzz. 73, Chris.

Specifications say it covers 500Khz to 905 Mhz. Minor difference unless you
are into 33cm and monitoring STL links and such.

> Who sells this radio mail order? For how much? Is it any good?
> Has it been reviewed anywhere? Is it better/worse than the Bearcat 760,
> how does it compare?

I first saw it several months ago in the Universal Shortwave catalog.
AES has carried it for quite a while. Dealer discounted price runs
around $600, maybe down to $500.

I've heard the front end overloads rather easily (can be expected with
such a wide range). It also supposedly has a video output which could
make it nice for ATV. I've been thinking about getting one of these so
I could listen to SWBC while travelling on long trips. I'm holding up
because the one place in my car where it would fit is occupied by a
2 meter rig which is waiting for a decent 3 band remoted transceiver
to replace it and open up the slot.

Source record: 19522

```
Bulletin ID: 7470_4Z4SV
From: 4X1AT@4Z4SV

CRUSADER FORTRESSES IN ISRAEL

The Israel Amateur Radio Club is having a 100 hour activity,
starting from April 21, 0800 UTC, through April 25, 1200 UTC.
Four stations will be activated from the remains of Crusader
Fortresses in Israel.

1) 4Z1A = Ashkelon - In the National Park.
2) 4Z2B = Belvoir - Overlooking the Jordan Valley.
3) 4Z3C = Caesarea - Next to the harbour.
4) 4Z5Y = Yehiam - The fortress of Judyn.

All the stations will be on the actual sites of the fortresses.
The activity will cover all bands, in CW and SSB.
Amateurs who worked-, or SWL's who heard-, all four stations,
may apply for a special award ($6.- ,10 IRC's or equivalent), to:
'Crusader-Fortresses Award', P.O.Box 4099, 61 040 Tel-Aviv, ISRAEL.

Please refrain from sending QSL cards. We, from our part, will send
a QSL, via the bureau, for every QSO, and will aknowledge every SWL
report.

I hope to meet many of you on the bands during the 100 hour lasting
activity of the IARC.

73 es Shalom, 4X1AT - President of the IARC.

Message-ID: <1234567890.AA00401@aring.eta.com>
Source record: 19444

As I continue to play with these twin-lead J-POLE antennas... I made the mistake of buying a whole roll of foam twin lead. Apparently the velocity factor of this stuff is very much different than regular (non-foam) twin lead. Does anyone know what this number is? Seems regular twin-lead is around .88 I'm guessing the foam stuff will be a lower number.

As long as we're (I'm) discussing velocity factors...how about PVC pipe? If one builds this twin-lead J-POLE and then slips it into a length of 1/2" PVC (sched 40) how much should he adjust the length of the twin-lead to compensate ?

>--

I don't want to be picky, but for the sake of information, such a radar gun was made and is still being sold here in the U.S. by Kustom Electronics, one of the biggest police radar makers. I has 2 antennas - one points out the front windshield, the other out the rear. The display has 4 lights that tell you which of the following cars is being clocked:

1. Target to the rear, travelling the same direction as the patrol car.
2. Target in front, travelling the same direction as the patrol car.
3. Target to the rear, travelling opposite direction (in oncoming lane).
4. Target to the front, travelling opposite direction (in oncoming lane).

This isn't the easiest thing in the world to accomplish. Take #2 case, for example. If the car in front of the patrol is going 70 mph, and the patrol car is going 40 mph, there is a 30 mph speed differential. However, in frequency difference due to the doppler shift, this is the same thing as 1) the patrol going 70 and the target going 40, 2) the patrol standing still and the target going 30 mph toward the patrol, 3) the patrol standing still and the target going 30 mph away from the patrol, 4) the patrol going 30 mph toward a parked car. The unit has to do quite a bit of thinking in order to determine what is actually happening. It does this by relying on a) what the other antenna is telling it, b) the RF being received other than what is being reflected off the target car (e.g. off the road surface), etc. It's quite complex, but apparently it works. By the way, are there any other netters out there who are interested in police radar? If so, I'd like to hear from you. I've been keeping up on it for a few years and have accumulated quite a bit of information if you're interested.

167. Good-bye PRO2004, Hello PRO2005!

Newsgroup: rec.ham-radio
Date: 1989-03-24 07:22:00 UTC
From: rh@well.UUCP
Message-ID: <11069@well.UUCP>
Source record: 19448

From the ANARC Newsletter, March 89:

Good-bye PRO-2004; Hello PRO-2005
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

Fans of the PRO-2004 scanner (marketed by Radio Shack, Grove Enterprises and others) were disappointed to learn that production of this model has ended. Those who haven't bought one yet were cheered by Radio Shack's inventory close-out price: $299.95. A few may still be left by the time you read this.

But fear not: the PRO-2005 is due out any minute. This model uses the same CPU and offers virtually identical capabilities: the same sensitivity, modes and frequency coverage (25-520 and 760-1300 MHz minus the cellular band). As with the 2004, cellular coverage will be restorable on the 2005 by clipping a single diode. However, the 2005's circuit-boards are more compact, with less wiring, so modifying it will require a finer touch.

The 2004 came with 300 programmable memories, modifiable to 400; the 2005 comes with 400 memories. Other differences: the slope of the control panel is steeper, for easier access when mounted under a vehicle dashboard. For tabletop use, there's a "kickstand" to raise the radio's front end for the same reason. The 2004's membrane keypad has been replaced by raised soft-plastic buttons, so the 2005 can be programmed "blind."

As we go to press, the retail price is still unknown. For more information, contact GRE America, 425 Harbor Blvd., Suite B, Belmont, CA 94002 (415-591-1400).

* voting YES = 119 *
* *
* voting NO = 24 *
* *
* * * * * * * * * * * * *
```

Well, although support has been shown for creation of the new group, the basic requirement for 100 more yes votes than no votes has not been met, (by 5 votes) therefore the new group WILL NOT BE CREATED at this time.

Since the vote did not pass, I don't think I need to waste bandwidth posting list of voters.

It was tempting to slip in a few of the 7000+ local user ids in as yes votes for the few additional votes needed to slip this one by, but.... oh well. 8-)

I like to thank all of you for your participation, both your no votes
as well as your yes votes. I attempted to acknowledge all votes received,
but got a small percentage back as undeliverable.

73 all

Jeff.......

I still have the Royal Exec Bare Bone repeater...

Has RX on 147.630. Sens is .15uv for 12db Sinad. Nice RX, have one
in service on 147.960 at this time with EXCELLENT results on a 'RF
Hill' here in CT (Pagers on UHF,VHF,LB, 102.9 5 Megawatt FM and 800
Mhz stuff) and have had very little intermod. As a matter of fact,
it was cut to Zilch when we put andrew 7/8" Heliax on the StationMaster!

TX is solid state, 30 watts switchable to 5 watts (For 150 watt PA
or Battery OP) on 147.030. Fine clean audio both local mike and repeat.

COR is Homebrew with TOT and adjustible hang time

Power Supply is also Homebrew, 13.8 vdc at 13 amps.

All mounted on a 12X17X3" chassis with a 7" Rack Panel on the front.

Have used it with seperate antennas with 60' vert seperation with little
desense and on a Wacom 4 cavity Bp/Br Duplexer with excellent results!

Am asking $425.00 with UPS included

73 and CUL

> 73 de WA2ISE

This whole argument is really getting ridiculous.

First of all there is no requirement in this country for a
person to need a license "before" they are allowed to own a
transmitter. It is only the use that is regulated.

And as for disclaimers. I have equipment from Heath, Kenwood,
Yeasue, Icom, Regency, Clegg, Gonset, Midland, etc.
Not one of these pieces came with a disclaimer stuck to
the top of the case. So why does everyone have to pick on Radio
Shack for maintaining a higher standard??

172. Kenwood RZ-1

Newsgroup: rec.ham-radio
Date: 1989-03-24 13:30:16 UTC
From: ewb@raybed2.UUCP
Message-ID: <1288@raybed2.UUCP>
Source record: 19440

RE: Kenwood RZ-1
I have had some experience with the RZ-1. Here are my views:

The radio is NOT for the real scanner enthusist. It is an entertainment
type radio. It scans too slowly for my taste, about 4 CH/sec, and has
an automatically adjusted squelch on AM (both mil and civil aircraft)
with no way to set it on the "hairy edge" for very weak signals. Sensitivity
seems to be lacking as well (measured by a subjective hearing test).
Programing seems unduly complicated. The Bearcat 760 is probably more
suited to your needs. Price range for the RZ-1 is about $499.00. Most
of the ham stores that carry Kenwood will probably have them. BTW
there was a rumor going around that Kenwood was going to market the
RZ-1 at via their stereo outlets instead of through their ham line.
Don't buy one until you see/play with one.

> What kinds of antenna should be used to maximize reception of
> VLF, especially of WWVB at 60 khz.

I couldn't hear WWVB at all here in Indiana, using a Palomar VLF converter and 200' long wire. With a Burhans VLF converter and Burhans E-field preamp and 3' (!) whip, it became one of the strongest signals in the very interesting VLF band. Another Burhans preamp for a 1m-diameter loop antenna works equally well.

> Wouldn't it be nice if hams could get use of the 160-190 khz
> (1750 meters) band with high power and no antenna restrictions?
>
> --phil ka9wgn--

It certainly would, but that band's usefulness is now limited by GWEN (Ground Wave Emergency Network) which transmits encrypted packets at high power.

-...-

The Palomar VLF converter uses a MC1496 balanced mixer in single-ended configuration, and performs poorly compared to Burhans' designs (which are inexpensive and home-brewable). Ralph Burhans is a retired EE prof who did a lot of LORAN-C and Omega work. _Byte_ magazine had an article on Omega navigation by Burhans over 10 years ago; I'm looking for the reference. He also wrote a series of articles about VLF receiving in _Radio Electronics_ in 1983. A complete set of reprints plus errata are available from the address below.

Yes, I too have been RIPPED off by Radio Shack. All I needed
was a 83.7 volt neon lamp for my science experiment due two days
later. Well, the kid behind the counter did not even have a
degree in engineering and completely misunderstood the premise of my project,
measuring the oxygen content on Mars during Earth's rush hours.

I could not believe it ! I spend at least $32 a year at that store and
you would think they would roll out the red carpet when I walk in !!
In fact, I complained that they did not have reserved parking for vense
vehicles with call letter license plates ! I mean after all, I am a
FCC licensed radio amateur !!!!

I do not care about the 30 day no questions asked return policy, it
is the principal of the thing ! They should go all out to satisfy
serious experimenters by stocking rare, seldom used components and be
happy with the 89 cent profit they will make on the remote chance
one of us geek's will buy one. I mean why stock the store with profit
makers like personal computers, scanners and radios ?

Well, I have to get back to monitoring phone calls on the neighbor's
49 Mhz cordless phone. Oh, and I need to make that mod to listen to
cellular phones tommorow. Well, some day Radio Shack will wake up and
realize we hams are mainstream America !

176. Re: Police Lasers...?

Newsgroup: rec.ham-radio
Date: 1989-03-24 15:49:21 UTC
From: WMartin@WSMR-SIMTEL20.ARMY.MIL
Message-ID: <12480586519.17.WMARTIN@WSMR-SIMTEL20>
Source record: 19452

The idea that a laser detector would not pick up any light from the hypothetical police laser speed-detector before it was being aimed at the car in which the detector is located is patently false. Remember that lasers are used as battlefield target designators. A laser is aimed at a target object by any one or more of many different possible sources (handheld by an individual, vehicle or aircraft-mounted, etc.). A completely different unit (soldier with shoulder-launched missle, anti-tank helicopter, whatever) fires a missile which contains a laser-light detector controlling its steering mechanism. That missile homes in on the laser-illuminated target by picking up the light reflected off the target. In the same way, a police-laser detector could pick up the light reflected off cars ahead of the detector-equipped car PRIOR to to the laser being actually aimed at itself.

1) Of course, this won't work when coming up a hill and the laser is being used on the far side of the hill. But current radar detectors don't work in that same situation -- the microwaves are almost as line-of-sight as this proposed laser, so the hill shields the current type of detector the same way.

2) If the police are being VERY sparing in their use of the laser, turning it on only when they already are looking at a car suspected of speeding, a detector won't signal you far enough in advance, if at all. The same thing applies to a current radar gun, though.

So there isn't an order-of-magnitude difference here in the net result.

Will Martin

PS Re the laser target designator. I always wondered what happens if the guy in the field makes a mistake and aims his target-illuminating laser UP, where the missiles flying around can detect it as a VERY strong source? He probably regrets it... Ouch! WM :-)

No, it wouldn't be nice. This band is the only place for folks like me to mess around with homebrew rigs, try any transmission mode, etc., without the code-test silliness. All we need is a bunch of appliance operators yaking it up down here, wasting chunks of this precious 30 kHz band.
Actually, it would be nice if we *all* could run say 10 watts instead of one. But when the FCC wrote the present rules, it was never dreamed that *unlicensed* people would communicate over ranges exceeding a hundred miles with one watt and a 1/35 wave antenna!

The Winnebiko III Project Needs YOU!
March 24, 1989

Help!

I have a problem. As you may have read elsewhere on the nets or in various magazines, I'm in the process of rebuilding the Winnebiko -- the computerized, solar-powered, recumbent bicycle that has already carried me 16,000 miles around the US. The new system is intended for open-ended international travel, with enough on-board computation, communication, and power-generation resources to make its location on the planet essentially irrelevant.

The design is developing well, and numerous subsystems are arising from the clutter of my temporary lab here in the wilds of Silicon Valley. But I've come to realize that hitting the road in this decade requires more manpower: wizards of all types, machinists, technicians, programmers, design engineers, PC fab houses, RF magicians, project-management heavies, and even a few crank-turners. I've bitten off a big one, and if I try to finish it alone I'll be old and fat by the time I return to the road (and the parts of the system finished first will already be obsolete!).

Are you interested in hands-on involvement with the Winnebiko? There's no direct cash in it, but there ARE some distinct benefits...

--> First and foremost, FUN. This continues to be the bottom line: that fundamental passion that makes our eyes light up at new gizmology, triggers dreams of future systems, and makes the whole idea of a computerized bicycle with real-time aerodynamic modeling, live mapping, navigation, CAD, solar power, regenerative braking, a handlebar keyboard, speech I/O, and a satellite earth station seem endlessly alluring. There

is a delicious feeling of conquering steep learning curves, applying creative skills across a wide range of specialties, beating trade-offs by inventing new rules or breaking old ones, and generally exercising the brain -- for this project is unlike most work in industry in that cost is no object. We have over 100 corporate equipment sponsors, habitually choose the best of everything, and remind ourselves constantly that this is art as well as engineering.

--> Second, there's glory in it. The system has spawned hundreds of magazine articles over the years, and I'm always happy to share the spotlight with those who have had a creative role in the design. If you're on a competitive career track, publication credits will dramatically spice up your resume; if you're looking for exposure, a few well-placed mentions are worth infinitely more than paid ads.

--> Third, there's strong potential for indirect money in it. This comes from two sources: product spinoffs and consulting gigs. A number of these subsystems have potential in environments other than compu-bikes, and I'm starting to build joint ventures to get a few of them into the market before someone beats us to it. And consulting deals come my way constantly -- instead of my usual mumbled, "uh, no, I'm too busy," I now refer clients to the people who have proven their wizardry on related projects. One fellow has billed almost $50K in the last year as a result of such leads; another is just now bootstrapping himself into full-time freelancing on the strength of CAA referrals.

--> Finally, there are all those other little things that add up. The Winnebiko design team (an ad-hocracy called Nomadic Research Labs) is a wild, networked community of kindred spirits: making contacts like this can have far-reaching consequences. You'll be kept current on the adventure, receiving a copy of my book and a free subscription the the Journal. And you just might be invited to trash your lifestyle and go for a long bike ride.......

The Winnebiko III

Before outlining specific projects I need help on, I should give you an overview of the new machine. After 16,000 miles, a number of deficiencies in the existing design have become apparent -- most notably architectural inflexibility as evidenced by the hardwired front panel. I'm tired of editing with a soldering iron, and the design is frozen in 1985 technology.

The key to the new structure is a "resource bus" controlled by a 68000 running FORTH. This is the bicycle control processor (BCP), responsible for active management of everything on board via a SCSI bus, I/O processor, and a few high-speed serial links. The SCSI

channel is expanded into a novel I/O structure that consists primarily of 128-point crosspoint matrices: Mitel parts that toggle an array of FETs as dictated by a field of RAM. Through these pass all serial, analog, and audio information on the bike.

Other I/O is more traditional, tying to a standard I/O expansion bus. The effect of all of this, stepping back one level of abstraction, is a five "channel" bus (power, serial, audio, analog, data) that links the following devices in any imaginable combination:

speech synthesizer low-power packet TNC
all-mode RF data system UHF transceiver (business)
2-meter VHF transceiver UHF transceiver (ham, sat)
10-meter all-mode transceiver cellular phone
cellular phone modem DTMF transceiver
analog mux (with quad-slope D-A) fax and modem board
console printer/plotter HF ham transceiver
GPS nav receiver with temp LORAN auto transmission logic
286/386 DOS engine security system and pager
audio cassette recorder entertainment electronics
bike instrumentation package 49 MHz full duplex base unit
speech I/O subsystem utility I/O board
audio processing board MIDI system
console DB-9 speakers and helmet headset
switched loads such as lights the BCP itself

Some of the interconnections, of course, would be absurd -- but consider some of the possibilities: Mobile phone patch between 10-meter ham QSO with Japan and cellular phone. Reconfiguration of packet datacomm to allow full remote console operations from manpack-laptop via UHF data link. Logging and diagnostics to disk file or console printer. Remote touch-tone commands to transmit local audio on 49 MHz or any other RF channel. Logging on to DIALOG and doing research while mobile. Introduction of audio filtering and other functions to enhance any communication mode. Synthesized security alerts that beacon the bike's exact coordinates on ham frequencies (or celphone 911) if it's ever moved without the correct password. Etcetera...

On top of all this, there are two DOS environments -- one a robust 286/386 for the CAD applications and computer-generated maps from CDROM, the other a low-power V40-class board for basic editing. These share a 40 Meg hard disk through a LAN and present the basic operating environment beyond the FORTH that actually runs the bike systems.

Two large console LCDs provide the bulk of the user interface, with a heads-up display a distinct possibility. A 640 X 480 VGA backlit DST LCD from Sharp is the main graphics display, but it requires a 2.5 watt backlight. When this is a drain on the power budget, the DOS systems can request a reflective super-twist 640 X 200 normally owned by the BCP. The HUD, if it happens, can be used

by any system -- primarily for text, database, and map graphics from CDROM and GPS data. Incidentally, the large display will be set behind a surface acoustic wave touchscreen to help support interaction with the mapping package (point to "contact" icon for a pop-up text box with corresponding database contents).

Speaking of power, there are 6 18-watt solar panels on the trailer, and 10 watts on the bike. These are bussed together to feed an array of switching power supplies associated with each battery, the status of which is actively metered by the BCP. The processor decides which battery bus is assigned to each load bus, switching them dynamically through a heuristic algorithm that attempts to track usage patterns and prevent loss of power on a dark night ride. The fallback position here is a variable-reluctance motor/generator embedded in the new rear hub, capable of sourcing enough power to run everything if I'm willing to put out the human effort. (Dynamic braking, by the way, is automatic -- a pot in the brake lever invokes this process invisibly before the hydraulic disc kicks in.)

Communications includes cellular phone with modem as well as a very robust ham station. The most interesting part of this is the OSCAR satellite station (modes B & J), which uses a collapsible antenna and a pair of multimode transceivers to uplink 435 MHz through 12 dbdc gain and downlink 145 through 10 db and a preamp (or the inverse). Supporting this is software in the PC that integrates orbital elements into a real-time graphic display of satellite location and footprint, along with AZ-EL-Range data. I do have to stop the bike for this, of course -- the beam array when extended is almost 9 feet long.

The BCP keeps busy doing things besides managing the bus and dealing with the handlebar keyboard and mouse -- it also controls the bike's new automatic transmission. Monitoring speed, cadence, torque, heart rate, and a subjective "wimp factor" keyed in at any time that indicates robustness of the engine, the system manages three Browning derailleurs covering 36 separate ratios. This seems a step backward from my existing 54 speeds, but of those, I use less than half. The key is range, provided equally well by the new automatic system.

There's more, but it gets progressively more detailed. Suffice it to say that the overall intent is to expand upon the existing theme of my "high-tech nomadics" -- maximum communication and computation ability without any geographic or utility support requirements. The obvious practical reason is the enabling of open-ended freelance writing and consulting without concern for location (linked via a web of networks to base office and publishers, powered by the sun, etc.) The originally unintended spinoff is a growing set of relationships with sponsoring companies, many of which are now becoming involved in technology-transfer joint ventures as the importance of some of these systems becomes interesting to a

wider segment of the population than computerized cyclists. And, of course, it is demonstrating through extensive ongoing media coverage a host of exciting new technologies... all flavored by fun and adventure that often seems too good to be true. The public loves it, while learning something at the same time.

The Project Potential

There are dozens of subsystems, custom parts, circuit boards, programs, packaging challenges, and various other system components that have to work together before the Winnebiko III can roll. Do any of these make your soldering iron, CAD system, or milling machine itch?

The transmission control system: linking speed, torque, cadence, and cardiac sensors to a dedicated micro under BCP management, and developing the algorithm that will learn from observation of my own shifting patterns under varying conditions. Output is six bits that control a trio of Browning transmissions.

Virtual front panel control for HF and satellite transceivers: using a micro to replace hardware front panels and present virtual radio consoles to the BCP screen. This may requires hacking of radio I/O logic, with the processor sleeping between commands to minimize RFI.

The solar/battery manager: processor control of the entire charging and power-distribution function, including interface with custom switching power supplies (under construction) and a quad-slope A-D scanning system voltage and current values. This subsystem should include full profiling of battery performance to aid in resource management.

CDROM-based mapping from GPS input: Nav data must be integrated with map data to produce a real-time wireframe model of surrounding areas, keyed by lat-long-el data to the database on hard disk. This is a big one. Subprojects here include GPS implementation, hooks into the map software, and the possibility of using a serious graphics engine to do the crunching.

Regenerative braking controller, working with the variable reluctance motor inventors and the battery management team. A bonus here is the potential for assigning the 118 watts of solar capacity to the motor for a small power assist (though I won't have enough battery to run the bike on electric power).

Trailer brake system: using a spring-extend double-acting cylinder built into the hitch and a pair of Mathauser hydraulic brakes, reduce the effective load of the trailer during braking to about 10% of its normal value.

Heads-up display system: helmet-mounted LCD with associated optics and backlight (optional), perhaps with a steerable optical path

to accommodate microfiche maps as well.

Improved handlebar keyboard: waterproof, fast binary keyboard with thumb mouse or other pointing device and a few other controls. Must be ergonomically optimized and non-interfering with mechanical hardware... and must work well with the MIDI system in flute-emulation mode.

Forward Reconnaissance Unit: This will only happen if the CAA team expands to include a nomad with spare cargo capacity, but it's interesting. Basically an RC plane with live video transmission via ATV channels back to a Walkman display. We're looking at the new Philips camera and AEA ATV boards, which have other applications on the bike as well.

Audio matrix system: Based on the Mitel array and a replicated normalization amp, this allows processor-controlled interconnection of any number of audio sources and sinks. Best accomplished as PC board, since the 32X32 array has an identical amp circuit on every I/O line.

Packaging projects: Beam antenna drawer, hard disk shock mounting, satcom area, and a variety of other attempts to protect delicate equipment in a brutal environment without robbing it of utility or making it too heavy.

Trailer system, mechanical: New trailer design with solar roof, battery compartment, RF and power cabling, and integration of related subsystems like brakes and antenna mast components.

Manpack system: DOS laptop with small solar panel, UHF packet system, and full duplex audio/video links. Must be rugged and waterproof... and it happens to be a model for a future commercial personal RF mailbox product.

Antenna system: With the help of KLM, Larsen, and Telex, optimize HF, satellite, VHF, UHF, and cellular antennas for minimum weight and maximum utilization of shared cabling. Satellite GaAsFET preamps must be protected from transmitted RF.

Video and Mini OCR system: CCD video to character recognition software... as well as to the FAX board (with suitable scan conversion). Same components transmit bike video to remote.

MIDI system: start with commercial MIDI products (Yamaha DX100 and Breakaway's Vocalizer) and interface to the bus, removing standard keyboard and control panel and replacing with virtual ones driven by handlebar keyboard, voice input, and sequencer software.

Peltier-based water server: Derive surplus solar or regen braking power and cool a Melcor thermoelectric device in a baffled water reservoir. A second Peltier device goes in the helmet for

active body cooling on hot days, pumping heat out through a heat sink in the airstream.

Software to accept scanned or other input and create bitmap images for output to the console graphics printer. These are primarily for on-the-road sponsor referrals.

Countless other software projects, ranging from FORTH tasks to dynamic airflow modeling. The environment consists of three DOS platforms, the 68000 FORTH system, an I/O processor, a high-speed array processor, and a half-dozen dedicated micros on the network. I assume a laptop Mac will provide biketop publishing capability by 1990.

Various mechanical projects as well: hydraulic rear disk brake, heavy duty headset bearing, new steering bearing, flip-down service/work stand for the whole bike, utility boxes, rear enclosure, etcetera.

... and so on. There are enough projects here to keep a whole party of creative people happy for months. If this were a company with a production deadline, I'd panic... as it is, I keep reminding myself that the bottom line is fun and this is artwork, not business. With that in mind, how do you feel about getting involved?

I can be reached most anytime at 408-263-0660. The address at this temporary Silicon Valley layover is 98 Sudbury Drive, Milpitas, CA 95035. Network addresses are:

180. RE: Suggestions, anyone? (Ham stations)

Newsgroup: rec.ham-radio
Date: 1989-03-24 21:14:14 UTC
From: rc@CMR.ICST.NBS.GOV
Message-ID: <8903242114.AA09247@cmr.icst.nbs.gov>
Source record: 19455

Brendan Kehoe asks for suggests for a beginner's station. Ron Natalie gives his shack's complement of gear. Since my is QUITE different, I'll do the same to represent another aspect of the field.

HF: TS-680 cover 160 - 10 (100 W) and 6 (10W), all voice modes and CW.
HF antennas are dipoles for 76 and 10.
(I'm on HF only for the purpose of working the VHF coordination nets.)

VHF: The above 680 works quite well on 6, but I don't use it there.
FT-726 with modules for 6 and 2 meters and 70 cm. Mirage amplifiers
for all three bands to give 100-150 W on each. I need, but don't have, a
tower-mounted preamp for 70 cm at least.
Antennas are: 6 el Cushcraft Boomer for 6 , LOOOOng boom, at 50 ft.
Cushcraft JR. Boomer at 56 ft for 2, fed with RG213.
16 el KLM for 70 cm (432), fed with RG213 - much too
much feed-line loss on this band.

I have an old Beta-test TNC-1, but haven't used it since I worked W0RPK on meteor burst with it years ago.

Also VHF: FT 290R instead of an HT, it has SSB and CW as well as FM.

As you can see, I'm no longer much interested in FM (the Clegg is put away), my activity is working DX by SSB and CW on 6 and 2. With a little more effort I would also be competetive on 70cm, a receive preamp at the tower top is really important on that band for weak signal work.

I encourage you to get on HF CW and become really proficient with CW, it is really important for DX work on the VHF/UHF bands.

It is really hard to do much VHF/UHF DX from the confines of most appartments. If it still strikes your fancy, think about week-end DX-peditions, etc.

Like some other on this net (KD5RO, I suspect), I just have never had any serious interest in the HF bands. They seemed too much like a screaming pack of wolves at each other's throats. This is much less true of 10.

As a further "confession", I think of VHF-FM more as a utility and a way to contact hams, rather than as being hams radio itself. (Wow, I can just hear the violent retorts to THAT!)

In any case, there are literally dozens of niches and facets to hamming, all of which contribute to its interest.

73,

Bob W3OTC

181. More bad news -- spectrum usage and the federal budget

Newsgroup: rec.ham-radio
Date: 1989-03-24 21:39:58 UTC
From: WMartin@WSMR-SIMTEL20.ARMY.MIL
Message-ID: <12480650348.17.WMARTIN@WSMR-SIMTEL20>
Source record: 19456

The following is from Audio-Video International, a consumer electronics trade publication, either the January or February '89 issue (the page torn out doesn't have the date), page 10:

Begin Quote
The government wants to auction off 6 MHz of spectrum space, estimating it could raise $2.3 billion during the 1990 fiscal year, and $1.1 billion in 1991 from the airwaves that are not now being used for mass media. Although details are sketchy, it appears that the White House hopes to set up a competitive bidding process that could be used for such new services as cellular radio and private mobile radio. In addition to the revenue from the original auction, the government counts on future income from annual license fees -- possibly up to $250 million per year. The spectrum auction is the third version of a Reagan Administration idea that is intended to find new revenue to offset the deficit. The concept may encounter congressional opposition -- as did the two earlier versions -- but some insiders believe Capitol Hill, also feeling the heat for new revenue sources, may be willing to deal on the issue this year. Among the possible compromises would be a spectrum leasing arrangement.

The spectrum allocation idea was a communications highlight of the final Reagan Administration budget plan, submitted to Congress less than two weeks before President Bush assumed office. Among other features of te 1990 budget is a beefed-up $109.8 million allocation for the FCC, up $10 million from the previous year's appropriation. The increased funding would help the agency's continuing crackdown on enforcement in such areas as satellite signal piracy.

Among the other media-related features of the 1990 budget plan is $14.6 million for the National Telecommunications and Information Administration (NTIA), nearly $1 million more than this year. Most of the new money would go toward hiring new staff at NTIA's Institute for Telecommunications Sciences in Boulder, CO.
End of item

Hmmph... Certainly a change from the 1980 campaign talk of shrinking the Federal Gov't, hmmm? How the mighty have fallen...

Well, any guesses as to just what spectrum space "not now being used for mass media" they are looking at?

Will Martin

>subcarrier systems. [...]

Rick,

Quite true; thanks for pointing this out. As you also explained, it is angular resolution, not signal-gathering capability, that is the limiting factor on C-band dish size because of the close spacing of the satellites. All this seems like a strong incentive to move to Ku-band for thin route applications. Have you seen a Qualcomm mobile data terminal? Now *that's* an impressively small satellite antenna!

Can anyone tell me what states make this illegal? I have a hard time hearing through a single ear, due to a differential frequency loss between each ear. I have never heard of this, although I can imagine some of the excuses that various police departments would use to "justify" the harrasment of the public through legislation like this.

> it would consist of a "boom" mike similar to what is available

I believe Heil makes these, but I think they are also of the two ear type. I don't see why that cannot be modified by removing one ear piece and replacing it with a resistor.

My TM-2530 often does this. I've heard it has been fixed for the 2530, but
I haven't had it fixed on mine. I suspect a bug in the microcode. Strange
that the same bug shows up again.

It would be helpful to post the name(s) of the dealers.

> Has kenwood quality assurance gone to the dogs?? Try phoning them.... nice
> answering machine but no one ever answers.

Don't use the phone number in their ads. Call the phone information for their
area and get their REAL number.

> Kenwood if you are reading take note of these complaints... I will be ready
> for you at dayton, better have the radio then!

I will be ready to hit them with their ambiguous ads on the new line of radios
they just put out. The model numbers indicate no 220 Mhz version, but the
ad mentions some sort of 220 Mhz capability in these single band radios.
I also wonder why they replaced the X21 series so quickly.

SpaceNews

MONDAY MARCH 27, 1989

SpaceNews originates at KD2BD in Wall Township, NJ, and is available on packet radio bulletin board stations across the North America and around the world on the MTTBS telephone BBS at (201) 494-3649, the Unix USENET News Network, and also on WangNet.

* SOLAR FLARE! *

A solar flare 36 times the size of the earth occurred on 09Mar89 on the sun's northeast quadrant. Ultraviolet and X-rays from the solar eruption hit the upper levels of the earth's upper atmosphere on Monday 09Mar89 at noon, just 8 minutes after the solar blast.

Researchers at Holloman Air Force Base in New Mexico believe this solar flare to be the largest ever recorded.

The violent solar eruptions disrupted long distance HF terrestrial communications as well as some satellite links on earth.

* OSCAR-9 NEWS *

All four HF beacons on OSCAR-9 have been switched on and are transmitting telemetry in 12 wpm morse code. The frequencies are 7.002, 14.002, 21.002 and 29.510 MHz. Interesting propagation effects can be noted when monitoring more than one beacon simultaneously.

On Thursdays (UTC), the VHF beacon will transmit telemetry in plain english using its Digitalker. The telemetry channels to be transmitted include:

08 : Battery Pack A Temperature (C)
09 : Spacecraft +X Facet Temperature (C)
17 : Magnetometer Experiment -Hz Fine
18 : Battery Pack B Temperature (C)
19 : Spacecraft -X Facet Temperature (C)
27 : Telecommand Receiver Current (mA)
28 : Radiation Experiment Temperature (C)
29 : Spacecraft -Y Facet Temperature (C)

The VHF beacon transmits on 145.825 MHz FM with 300 mW of transmitter power. The HF CW/A0 beacons run 100 mW each.

* MICROSAT NEWS *

UoSAT-D and E Status Report:

Work is continuing at the University of Surrey on the UoSAT-D and E spacecraft which are to be launched as secondary payloads, along with 4 Microsats, on the SPOT-2 Ariane launch in the fourth quarter of this year.

The primary payloads on the UoSAT-D spacecraft are the VITA/AMSAT-UK Packet Communications Experiment (PCE) and a Cosmic Particle and Total Radiation Dose Experiment. On UoSAT-E there is a Transputer experiment, CCD imager and Solar Cell calibration experiment.

- PCE

The PCE prototype PCB has now been thoroughly tested and work is proceeding with integration of the 4 Mbyte 'RAMDISK' that will be used to store the messages. A prototype of the complete module will be shipped to Harold Price, NK6K, soon to allow the operating system to be tested. The operating system is the same as that being used on the Microsats, but the message and housekeeping software will be written at UoS.

- 1802 Computer

The 1802 computer has also been extensively tested, and has now been running for several weeks. A new version of the FORTH diary (V2) has been generated and is running on the hardware. Several additions have been made to the software, such as support for the Solar Cell and Transputer experiments. Also a new boot loader has been written and tested to allow the FORTH diary to be loaded.

- Transputer Experiment

The Transputer Experiment, which is being provided by ESA-ESTEC, was brought to the UoS for testing last week. The experiment was successfully tested with the 1802 computer, which is used during 'booting' of the processors. Also the link from the transputer to the CCD imager was checked. A high speed bi-directional serial link is used to transfer image data and to send control information to the CCD.

- Solar Cell Experiment

The prototype PCB has now been fully tested, and data has been transferred using the interface to the 1802 computer. The biggest problem encountered so far has been setting up two 500W DC light bulbs and associated power supply to make a small scale solar simulator. DC is required to prevent 50Hz noise which is visible on the output of AC driven bulbs.

[Story via OSCAR-11.]

For sale messages are not allowed on the Arpanet side of this
newsgroup. Please use rec.ham-radio.swap which is not gatewayed to
the Arpanet side.

The quote below, from a message I received on the subject, summarizes
the situation.

--forwarded message--
(sender's address omitted as it was a private msg).

Keith,

In my capacity as moderator of [an Arpanet Digest], I specifically
asked the people who run the ARPANET what the policy is a couple years
ago, and the message that came back was clear: no commercial
solicitations. My strong understanding is that this includes, for
example, people trying to sell their equipment via ARPANET digests.

In fact, I've been a little concerned about Info-Hams for a while
because of this, and have come close to sending you a note about it
once or twice before. I'd hate to see us get shut down because of
such a trivial and relatively unimportant part of Info-Hams as
classified ads for rigs-for-sale.

---end forwarded message---

As I've stated before, I have no power to change this Department of
Defense policy. If we cannot voluntarily comply on the Usenet side
of this newsgroup I will have no choice but to ask that the gateway
between Usenet and Arpanet be shut off.

188. Need schematic for C-IV to RS-232 interface

Newsgroup: rec.ham-radio
Date: 1989-03-25 12:00:09 UTC
From: cs313s31@uhccux.uhcc.hawaii.edu
Message-ID: <3574@uhccux.uhcc.hawaii.edu>
Source record: 19461

HELP!

I just priced the interface that allows my IC-735 to talk to
RS-232 devices... it lists for $90 U.S.! Dealer discount
knocks it down to $65... but that is still exorbitant.
Does Anyone out there have the schematic for this critter?
I would like to just build it myself, if I can.

189. A carrier operated light for the PRO-2004 [repost]

Newsgroup: rec.ham-radio
Date: 1989-03-25 12:33:46 UTC
From: parnass@ihuxz.ATT.COM
Message-ID: <4265@ihuxz.ATT.COM>
Source record: 19462

Several PRO-2004 owners have asked for a repost of this article:

x-------------- CUT HERE ------------------------------------x

A CARRIER OPERATED LIGHT FOR THE PRO-2004 SCANNER

by Bob Parnass, AJ9S

The July 1988 issue of Monitoring Times suggested that it may be easy to add an S-meter to the Radio ShackO PRO-2004 scanner:

"...But adding an "S" meter is even easier than previously thought. Pin 10 on the IF amplifier (IC1) is an "S" meter output. With the proper bridge or meter buffer/amplifier an "S" meter is reality...."

Brace yourself for disappointment - the integrated circuit mentioned in the article is used for WBFM only. Despite the internal IC block diagram in the service manual, pin 10 on my PRO-2004 is useful as an S-meter output only when the radio is in the WBFM mode.

Between pin 10 and ground, I placed a 10,000 ohm resistor in series with a 250 microamp meter for a simple test setup. The meter read full scale on strong signals. With no signal at all, the meter read about 70% of full scale. When the mode is set to AM or NBFM, the meter was always at zero.

One could add a bridge circuit here, but this metering point is of limited utility.

Add a Light Instead

With a room full of functioning scanners, it's difficult to determine quickly which radio is "talking." I use separate external speakers on each radio, and the spatial separation helps.

In addition to "hearing" which radio is active, I like to "see" which radio is active, and carrier operated lights are effective at providing such visual cues. The idea is to illuminate a lamp when a signal opens the squelch. A small yellow light emitting diode (LED, another Bell Labs invention) is well suited to this purpose. The following modification works well on all PRO-2004 modes.

To add a COR light to the PRO-2004, make use of the "scan control" pin (pin 13) on IC2, the TK10420 IC. Pin 13 has voltage present only when a signal is detected. This chip contains the IF, detector, limiter, and squelch circuitry for NBFM.

If you tremble with an electric drill in your hands, read no further. The LED can be mounted in a small hole drilled through the plastic front panel, just to the right of the headphone jack.

Electronically, the circuit is simple. The voltage at pin 13 is not enough to drive the LED directly, so a general purpose NPN transistor (e.g., a 2N2222) can be used as a solid state switch.

- Pin 13 of IC2 is connected to the transistor base through a 10,000 ohm resistor.

- The emitter is grounded.

- The collector is connected through a 1000 ohm resistor to one end of an LED. This resistor limits the LED current to about 13 milliamps.

- The other end of the LED is connected to one contact on the rear of the PRO-2004's on/off, volume control. This furnishes about 14 VDC unregulated to the circuit. The back of the on/off switch has two contacts. Use the one with the brown wire connected to it, as this contact is only "live" when the scanner is turned on.

I mounted the 2 resistors and transistor on a small PC board, which I fastened to the PRO-2004 chassis using a metal standoff.

From: ddodell@stjhmc.fidonet.org
Message-ID: <2945.242BA7AA@stjhmc.fidonet.org>
Source record: 19463

In an article of <24 Mar 89 17:44:36 GMT>, jans@tekgvs.LABS.TEK.COM (Jan Steinman) writes:

>Who is this dealer, so I can avoid him? I might understand a "no refund"
>policy, but he should have offered you new units in exchange for DOA
>units, NOT
>repairs!

I have had the same problems with the Ham Radio Outlet in Phoenix ... but I don't know if this is the policy across the whole chain.

Also, Yasaeu didn't back up their product. I had a dual-bander that was back in the factory for 3 trips out of the first 6 weeks of ownership. I asked them to simply replace it with a new unit, which they refused. I eventually sent them a Mailgram telling them to keep the unit, and reversed charges on my Mastercard.

That is one suggestion I would recommend to anyone buying a radio. Buy it on your credit card ... if there is a problem when you buy the radio, and the local dealer refuses to satisfy the problem, just reverse the charges. With my local bank, if I can document to them that I made a fair attempt to resolve the problem, they will usually side with me and reverse the charges on my card, and debit the charge back to the dealer.

192. Re: RS 10m rig ad

Newsgroup: rec.ham-radio
Date: 1989-03-25 21:50:46 UTC
From: karn@ka9q.bellcore.com
Message-ID: <14958@bellcore.bellcore.com>
Source record: 19467

Recently I was reading through the ARRL VE manual (I'm thinking of becoming a VE -- I figured I oughta help with all those no-code applicants we'll be getting soon!) when I noticed something on the Form 610 I had largely forgotten:

"I CERTIFY THAT...the station to be licensed will be inaccessible to unauthorized persons."

Seems rather silly, since copies of all of the equipment in my shack (except for the homebrew stuff) can be easily bought by anyone without a license...

One of life's little ironies, I guess.

Phil

193. Grid Dip meter

Newsgroup: rec.ham-radio
Date: 1989-03-25 23:35:53 UTC
From: edw@wells.UUCP
Message-ID: <21@wells.UUCP>
Source record: 19466

Does anyone have a Grid Dip meter that they would like to sell?
If so, send mail to edw@wells.

194. 2-30MHz Broadband Amps

Newsgroup: rec.ham-radio
Date: 1989-03-25 23:49:28 UTC
From: guhsd000@crash.cts.com
Message-ID: <4015@crash.cts.com>
Source record: 19470

I'm looking for a manufacturer of 2 - 30MHz broadband Amps. I have schematics for several, but don't have sources for the various Toroid cores and other
ceramic coils, chokes. This is esp true for Ferroxcube products.

If anyone knows of a manufacturer for the amps them selves or a good places to get a wide range of coils, chokes, and cores, please send me mail.

Thank You, Paula Ferris

195. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1989-03-26 00:30:35 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <8903260032.AA13749@ucbvax.Berkeley.EDU>
Source record: 19469

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

196. Problems with Ham Radio Outlet (was Problems with TM-721 dual bander)

Newsgroup: rec.ham-radio
Date: 1989-03-26 04:48:17 UTC
From: john@stiatl.UUCP
Message-ID: <3913@stiatl.UUCP>

>
>I have had the same problems with the Ham Radio Outlet in Phoenix ... but I
>don't know if this is the policy across the whole chain.

I also have had problems with Ham Radio Outlet (HRO) here in Atlanta. Based on my recent experiences, I now recommend HRO be avoided at all costs. They seem to be sharing the symptoms of any vendor who gets too big.

My most recent experience involved trying to buy a dual-band HT. I went in HRO about 10:00 one weekday morning. I was the only customer in the place. One salesman was on the phone and the other was shuffling paper. (I know these guys but will not use names). I stood around for almost 20 minutes before one of them asked what I wanted. I asked to see what they had in the way of dual-band HTs. The guy put an Icom and a Yaseau on the counter and disappeared again. No discussion and no interest in selling. About 10 minutes later, he returned and I asked him the price of the Icom - the one I was interested in. He gave me a price about 10 bux off list. I asked if that was the best price he could do. He got abusive and told me to take it or leave it. About that time, the other guy looked up from his paper-shuffling to also say "take it or leave it". At that point, I did just that, and left - and bought the radio mailorder for about 75 bux less and without tax..

I cannot understand this attitude. I had 500 bux in cash ready to buy a radio and could not interest them long enough to even talk to me. I have ALWAYS had to wait for service at HRO and when I get it, they act like they are doing me a favor to sell me something.

Another incldent happened last summer. I was then editor of The GrapeVine, the newletter of GRAPES, the Georgia state packet group. I had been pushing a membership drive through the newsletter and was strongly urging people to join GRAPES and support our networking efforts. During this period, the manager of the local HRO store sent me a packet EMAIL message in which he stated that he could see no reason why someone should join GRAPES because if GRAPES did not erect switches and digipeaters, SOMEONE would. What an attitude!

I'd be interested to see if this is common to all HRO stores or just unique to Atlanta. I suspect from what I've read and heard that it's characteristic of the chain.

73, john

197. Re: Kenwood RZ-1

Newsgroup: rec.ham-radio
Date: 1989-03-26 04:57:00 UTC

> of the ham stores that carry Kenwood will probably have them. BTW
> there was a rumor going around that Kenwood was going to market the
> RZ-1 at via their stereo outlets instead of through their ham line.

About a year and a half ago I was interested in finding a DIN mount stereo for my car that had SWBC bands. I listen to some SWBC stations on occaision. I'd like to do so in my car without the hassle of trying to tune my Kenwood R-11. That radio is so light, and the tuning so tight, you almost have to hold the radio to do so. It is generally awkward in the car. A DIN size radio mounted properly would be great. I went to a few stereo dealers and asked if such a thing was around. No one ever heard of any, but one gave me the sales rep number for Alpine. I called them and found out that Alpine sold in USA is really a Japanese product, not the European one, and that there was no market in the USA for any shortwave radio.

It looks like the RZ-1 will fit the situation. As long as you don't expect miracles from it, it should be able to adequately do shortwave reception, and give you some other things on the side. Now as soon as the place I want to mount it is free (occupied by a TM-2530 waiting to be replaced by a decent 144/220/440 transceiver with remote head, whenever one comes out) I will be reconsidering the RZ-1 and fairly likely to get it.

In article <12480586519.17.WMARTIN@WSMR-SIMTEL20> WMartin@WSMR-SIMTEL20.ARMY.MIL (William G. Martin) writes:
]The idea that a laser detector would not pick up any light from the
]hypothetical police laser speed-detector before it was being aimed at the
]car in which the detector is located is patently false. Remember that
Misc comments about LASER target designators deleted...

You forget a couple of things...

The target designators are designed to generate lots of recognizable reflected light - hence they carry coded modulation and are relatively high power.

The police radar is short range and only needs to put out enough power to see the reflection itself. Although the standard radar countermeasure rules apply (target has 1/d^^2 while radar has 1/d^^4 signal strength), the police radar CAN (I don't know for sure how they work) have a couple of extremely important advantages:

(1) It can use a high gain directional antenna on the receiver (i.e. a telescope), while you can't on your LIDAR detector. It knows where the target is - you don't.

(2) Most important - it can use narrow band receiver techniques to discriminate it's signal from background signals - you can't, since you won't know PRECISELY what frequency it is on.

(3) It doesn't need to use coded modulation (which you could use to discriminate it from the background noise) because of (2) above.

To make the above comments clearer, let me describe a hypothetical radar receiver:

You have a collimated transmitter beam and a telescope aimed at the target for the receiver (probably use one set of optics and a beam splitter). You take the returned beam (after going through a narrow band filter) and interfere it with the outgoing beam. The rate of change of the interference pattern represents the phase change rate of the target (times the cosine factor) and will generate an rf signal (by my quick and maybe wrong calculation, about 30 MHz) in a detector diode. You then detect the frequency of this signal and calculate the vehicle speed.

Now imagine the plight of the LIDAR detector. It doesn't know exactly the frequency of the beam (it may know that it is a gas laser at some standard mode, but that isn't close enough to use for a very narrow band detector). That means that it must try to detect any

signal in a certain range. If the police radar uses a tunable laser
as a countermeasure, this signal will be over a fairly wide range
of light frequencies. The same signal range will have high background
noise: sunlight, etc). The police radar can discriminate this
by coherent detection - it has the original coherent signal. (really,
this is what the interferometer is doing). You can't.

199. vk2sg rtty report 3/24/89

Newsgroup: rec.ham-radio
Date: 1989-03-26 19:17:51 UTC
From: gws@n8emr.UUCP
Message-ID: <953@n8emr.UUCP>
Source record: 19476
Cross-posted to: rec.ham-radio,rec.ham-radio.packet

It was suggested that I post this bulletin to rec.ham-radio
instead of rec.ham-radio.packet. I basicly decided on .packet because
both packet and rtty are "digital" modes. It dosent really matter
where I post the articles. So its up to you Do you want it posted
in rec.ham-radio or rec.ham-radio.packet?

Thanks in advance for your comments.

RTTY DX NOTES FOR WEEK ENDING 24TH MARCH 1989
(BID RTDX2403)

FIRST, WE HOPE THAT EVERYONE HAS A VERY HAPPY AND HOLY EASTER. WE HOPE
THE DX COMES TO YOUR SHACK IN GREAT ABUNDANCE. IN THE NOTES YOU WILL SEE
SOME STATIONS LISTED AS 28 MHZ, ETC. THESE WERE SOME OF THE STATIONS WHO
WERE WORKED/SEEN DURING THE CONTEST. UNFORTUNATELY WE COULD NOT LIST ALL
THE STATIONS THAT WERE IN THE CONTEST, AS SOME OF THE STATIONS WORKED OVER
700 CONTACTS. SO ONE MIGHT SAY THAT ALL BANDS WERE OPEN AT SOME TIME
DURING THE CONTEST PERIOD.

OUR THANKS THIS WEEK GO TO TG9VT, W1DA, KT7H, LA5WBA, OD5NG AND VK2EG.

BANDPASS:

FRIDAY.

IT IS REPORTED THAT JIM SMITH WILL BE ACTIVE FROM OCEAN ISLAND, EITHER THE
END OF APRIL OR EARLY MAY. IT IS HOPED THAT HE WILL THEN TRAVEL TO TUVALU
(T2) IF REQUESTED.

5W1GP WILL BE QRV FROM ROTUMA FROM 6TH APRIL. HIS LENGTH OF STAY IS NOT KNOWN, BUT HE WILL BE OPERATING BATTERY EQUIPMENT.

XF4L REVILLA GIGEDO WILL OPERATE FROM 11TH TO 19TH. THEY HOPE FOR RTTY OPERATION AS WELL AS OTHER MODES. QSL TO OH2BN.

MARION ISLAND, ZS8 WILL BE ACTIVATED DURING APRIL. EQUIPMENT HAS BEEN DONATED BY W6PQS AND THE SOUTHERN CALIFORNIA RTTY GROUP.

MAY.

ST PETER AND ST PAULS ROCKS WILL BE ACTIVATED 3RD TO 10TH MAY . THE RTTY CALL WILL BE ZY0SY. OPERATION BY THE NATAL DX GROUP BRAZIL.

JUNE.

TK/HB9CJC WILL OPERATE FROM CORSICA FROM JUNE 4TH TO JULY 2ND. QSL TO HIS HOME CALL.

JG1RVN WILL OPERATE FROM KC6, BELAU, DURING JUNE. QSL TO HIS HOME CALL.

AUGUST.

ANGOLA HAS BEEN DELAYED UNTIL AUGUST DUE TO CHANGE OF MILITARY PERSONEL. QSL VIA I5ICY.

GL DE DX1.

:: SWEDEN CALLING DXERS ::
:: from Radio Sweden ::
:: Number 2035--Mar. 21, 1989 ::
::::::::::::::::::::::::::::::::::

Shortwave and other electronic media news from Radio Sweden.

This week's bulletin was written by Bengt Dalhammar.

Electronic Edition edited by George Wood.

Packet Radio BID SCDX2035

-------------------------------------------------------------------------------

SWEDEN--Beginning Mar. 26, 1989, Radio Sweden is expanding broadcasts in
Estonian and adding a new language, Latvian. The two languages will be
broadcast 16:45-17:00 hrs on 1179 and 6065 kHz.

There are major changes in our English schedule as well from Mar. 26:

Our times to North America are changing. The broadcast at 14:00 hrs, which
we've had for many years, is being changed to 15:30 hrs. The new frequencies
then are 17880 and 21610 kHz. At this same time we're also broadcasting to
Asia and the Pacific on 17705 kHz.

The 02:30 hrs broadcast to North America is also changing to a new time--
03:00 hrs. The frequencies will be familiar--9695 and 11705 kHz.

Turning to Asia and the Pacific, the 12:30 hrs broadcast has new frequencies
of 17705 and 21610 kHz. Those same two frequencies will also be used at 14:00
hrs, to Asia and the Pacific.

There's a new broadcast to that part of the world at 01:00 hrs. The
frequencies are 15390 and 17790 kHz.

We no longer broadcast to the Middle East or East Africa, and the European
broadcast at 15:30 hrs has been switched to North America. European and
African listeners can look for us at 18:00 hrs, which replaces 17:00, on
1179, 6065, and 9615 kHz. And at 21:00 hrs on 1179, 9655, and 11705 kHz.

ARGENTINA--Radio Argentina al Exterior now broadcasts: in Arabic 17:00-17:30,
English 17:30-18:30, German 18:30-19:30, French 19:3+0-20:15 and Italian
```

20:15-21:00 hrs. The frequency is 15345 kHz. (Pierre Chalard, France and Peter Andrewitz, West Germany)

COSTA RICA--Radio for Peace International has begun broadcasts in the 11 meter band, on a frequency around 25945 kHz, sometimes heard as low as 25934. The operating hours are 14:00-18:00 and 21:00-24:00 hrs, in parallel with 21560 kHz. The new frequency may also be used 18:00-21:00 hrs. (Glenn Hauser via "Contact", UK)

CYPRUS--Updating SCDX-2027, the Cyrpus Broadcasting Corporation can be heard in Greek to the United Kingdom Fridays and weekends 22:15-22:45 hrs as well on 9580 kHz. This is in addition to the previously reported 6030 and 7180 kHz. (Uwe Gruner, West Germany)

WEST GERMANY--Beginning April 3rd, the Italian service of Deutschlandfunk will move to a new time, 22:30-23:00 hrs, on 1539 kHz. The DX program, broadcast on Mondays, will be heard at 22:45 hrs. (Salvatore Placanica, Italy)

HAITI--Political disturbances in Haiti continue to affect broadcasting. On March 6th a conflict at the Catholic station Radio Soleil put the station off the air, while the director declared a hunger strike. The station has been an outspoken critic of human rights abuses in Haiti. Journalists at Radio Soleil say the conflict is between the country's conservative Church hierarchy and the director, Father Hugo Triest, who takes a more progressive editorial stand. The technical staff have sided with the bishops, and took the station off the air, after he had fired the technical director.

Radio Nationale reports that a judge has ruled that Radio Antilles Internationales can resume broadcasts on FM 93.5 MHz. The station had been taken off the air by the authorities in October. (BBC Monitoring)

LAOS--Updating SCDX-2030, the Laotian regional station at Savannakhet now broadcasts on 7385 and 1420 kHz. Broadcasts are weekdays 22:30-01:30 and 11:00-14:00 hrs, and weekends 22:30-01:30, 04:30-06:00, and 10:30-14:30 hrs. (BBC Monitoring)

MAURITIUS--According to a letter from the Studio Manager of the Mauritius Broadcasting Corporation, the transmitter on 4855 kHz, which has long been off the air, is to resume in the future. ("DXclusive", Finland) The African station heard time to time on or near this frequency is usually Mozambique. (DX Editor)

PAKISTAN--Radio Pakistan is broadcasting to Europe on a new frequency 15545 kHz, replacing 9760. This concerns Urdu at 16:45, and 18:00, English at 17:18, and French at 19:15 hrs. 11570 kHz is in parallel. The new Radio Pakistan address is: English Section, World Service, Radio Pakistan, Box 1393, Islamabad, Pakistan. (Aristides Giannarelis, Greece and Jiri Tieftrunk, Czechoslavakia)

PORTUGAL--Radio Portugal International has a program in English to India and the Middle East weekdays 18:00-18:30 hrs on 15210 kHz. (Salil Kis Paul, India)

SPAIN--The Radio Exterior de Espana broadcast in Spanish 19:30-22:45 hrs is now on 21460 kHz, which seems to replace the previously used 11880. (John Killian, Virginia, USA)

TONGA--The Tonga Broadcasting Commission has been heard on 5030 kHz at 07:00 hrs. (Douglas Doull, New Zealand)

TRINIDAD--The Government of Trinidad is considering granting licences to addtional radio stations. At the same time, it also wants to make it compulsory that at least 40 percent of all radio entertainment programs reflect local content. There are currently two radio stations in Trinidad: the Trinidad Broadcasting Company and the National Broadcasting Service. (Karel Douglas, Trinidad)

USA--Russian from KGEI at 02:00-06:00 hrs has been heard on 11680 kHz, apparently replacing the listed 7365. (Frank Hermann, GDR)

VENEZUELA--Radio Nacional de Venezuela has one hour broadcasts in Spanish at 11:00, 14:00, 18:00, 21:00, 24:00, and 03:00 hrs. The frequencies are 5020, 9540, 11695, and 11850 kHz. Howwever, the 11:00 hrs has been heard signing off as early as 11:25. (Karel Douglas, and an anonmynous contributor).

Sweden Calling DXers is the world's oldest radio program for shortwave listeners. Radio Sweden has presented this round-up of radio news, features, and interviews on Tuesdays since 1948. RS broadcasts to North America:

14:00 hrs on 15345 and 21615 kHz
02:30 hrs on 9695 and 11705 kHz

To Europe, Africa, and the Middle East:

03:30 hrs on 11705 kHz (Middle East)
15:30 hrs on 15240 kHz (East Africa)
18:00 hrs on 1179, 6065, 7265, and 11845 kHz
21:00 hrs on 1179, 6065 and 9655 kHz
22:30 hrs on 1179 kHz

And to Asia and the Pacific:

12:30 hrs on 15190, 17810, and 21570 kHz
14:00 hrs on 17810 kHz
15:30 hrs on 15330 and 17810 kHz

The Radio Sweden schedule to Europe can be found on Sky Channel's teletext Service, Sky Text, on page 496.

The Electronic Edition is based on the Sweden Calling DXers bulletins which are mailed out every 4 weeks to contributors. Contributions can be sent to DX Editor George Wood to Swedish telex 11738, CompuServe (via the HamNet Forum or Easyplex 70247,3516), through the FidoNet system to 2:501/297 or to SM0IIN at the packet radio BBS SK0TM.

Reports can also be sent to:

Radio Sweden
S-105 10 Stockholm
Sweden

Contributions should be NEWS about electronic media--from shortwave to satellites--and not loggings of information already available from sources such as the "World Radio TV Handbook". Clubs and DX publications may reprint material as long as Sweden Calling DXers and the original contributor are acknowledged, with the exception of items from BBC Monitoring, which are copyright.

We welcome comments and suggestions about the electronic edition, Sweden Calling DXers, and our programs in general.

Thanks for 65 contributors this week Good Listening!

201. Re: 2-30MHz Broadband Amps

Newsgroup: rec.ham-radio
Date: 1989-03-27 02:20:57 UTC
From: cs313s31@uhccux.uhcc.hawaii.edu
Message-ID: <3579@uhccux.uhcc.hawaii.edu>
Source record: 19474

You won't find those dealers easily... the sale and distribution of linear amplifiers capable of opreation on 11 meters is illegal.

If you need info on building one for yourself, though, try Motorolla. They have technical reports available on how to use various MRF transistors in broadband amplifiers.

Aloha,
John KJ9U/KH6 (Happy Easter!)

202. Re: Headphone/mic system wanted

Newsgroup: rec.ham-radio
Date: 1989-03-27 04:23:42 UTC

Message-ID: <1241@naucse.UUCP>
Source record: 19472

I believe that wearing "both ears" headphone may be illegal
now in Texas. When I was living there several years ago I
know there was serious discussion about this since a number
of fatal traffic accidents had been attributed to driver's not
hearing warning signals (trains, etc). Easy to understand why
if a person was driving a car during the summertime there with
all the windows rolled up, the air conditioner going full blast,
and the radio/tape deck cranked up. There were a lot of teen-agers
blasting about with stereo headphones at that time, also.

I left the state before the outcome was decided. If you know for
sure what the status is in your state, please E-Mail me and I will
summarize for the net.

Many thanks -

```
******************| ANARC CLUB-SCAN: March 1989 |******************

Tom McElvy starts editing a new computer column in the next issue
of the "American Scannergram"... In the March/April issue, Dave Jones
profiles the US Postal Service's radio use and an encrypted radio
system the FBI is building for itself and the DEA; Bob Jacobs
explains mobile radio extenders, used in public safety communications;
Fred Vobbe tells how to feed two receivers from a single antenna;
Curtis Harbin reviews the PRO-34 scanner; and a list is given of AOSC
members who can be reached via the ANARC BBS... Dues for the * ALL
OHIO SCANNER CLUB * go up May 1st to US$15/year - except for
Canadians, who pay US$18/year...
AOSC address: 50 Villa Road, Springfield, OH 45503 USA; dues
$15.00/year; sample bulletin $2.00 to No America, elsewhere 3 IRCs.
*********************************************************************

In the March "DX Reporter": "USSR HF Broadcasting Newsletter"
publisher Roger Legge says it's time for RFE/RL, VOA and Radio Moscow
to cut back on their spectrum use; Gus Stellwag reviews Datong's
Automatic Notch Filter; Don Schimmel reviews "The Air Force
Communications Command, An Illustrated History"; Mark Fosella tries
to imagine the voice-machines used at "numbers" stations; and all
the names/addresses of the * ASSN. OF DX REPORTERS' * members are
given...
ADXR address: 7008 Plymouth Road, Baltimore, MD 21208 USA;
dues $17.00/year No America, elsewhere by surface mail $19.00/year;
sample bulletin $1.00 No America, elsewhere 5 IRCs.
*********************************************************************

The * CANADIAN INTERNATIONAL DX CLUB's * Sheldon Harvey gave the
banquet speech at the recent SWL Winterfest in Pennsylvania. Ways
to promote shortwave listening was his topic, and he gave more good
ideas per minute than seemed humanly possible (Sheldon quit his job
to devote all his time to SW promotion)... The 1989 bibliography of
references on postage stamps featuring radio subjects has been
published by Neil Carleton (P.O. Box 1644, Almonte, Ontario, K0A 1A0
Canada). To get a copy of this unique resource, send Neil a self-
addressed envelope with Canadian postage (Cdn$0.58 for Canadian
addresses, Cdn$0.64 to the US, Cdn$1.17 elsewhere), or International
Reply Coupons (1 for Canada/US, 2 elsewhere)...
CIDX address: #61 - 52152 Range Road 210, Sherwood Park, AB,
T8G 1A5 Canada; dues USA $25.00/year; Canada CN$26.00/year;
elsewhere by airmail CN$32.00/year; sample bulletin $1.00 in North
America, elsewhere $2 or 4 IRCs.
*********************************************************************
```

European membership in * CLUB ONDES COURTES DU QUEBEC * has grown so much in recent years (approaching 50% of the total) that Jean-Michel Aubier has been named COCQ's European representative, and Norbert Fouquet (B.P. 74, 40600 Biscarrosse, France) is now authorized to take payment for Euro memberships in French francs. At current exchange rates, COCQ's overseas dues are 210 FF/annee...
COCQ address: 160 rue Prieur ouest, Montreal, PQ, H3L 1R5 Canada; dues CN$35.50/year, elsewhere CN$37.50/year; sample bulletin (all in French) NA $1.50; elsewhere 5 IRCs.
****

The * INTERNATIONAL RADIO CLUB OF AMERICA's * "Goodie Factory" has a new manager: Floyd Perry, 6408 Morgan Place #218, Stockton, CA. All orders for IRCA article reprints now go to him... The Feb 25th "DX Monitor" had a first-hand report on radio broadcasting in Nicaragua by Jorma Mantyla, as well as John Bryant's comments on the importance of grounding and impedance-matching for Beverage antennas (Steven Lare offers a transformer for this purpose in "MarketScan," below)...
IRCA address: P.O. Box 21074, Seattle, WA 98111 USA; dues USA $20.00/year; Canada/Mexico $26.00/year, write to club re other areas; No American trial subscription (10 issues + New Member Packet), $7.50; sample bulletin $.50 in No America; elsewhere 3 IRCs.
****

In the March issue of the * LONGWAVE CLUB OF AMERICA's * "Lowdown," Max Carter explains how to build an add-on digital frequency display for analog receivers that operate below 30 MHz. The parts cost about $40. His design reads to the nearest 100 Hz (the nearest 10 Hz in the longwave band) - though with only 4 display digits, so 12745.5 kHz shows as 745.5....
LWCA address: 45 Wildflower Road, Levittown, PA 19057 USA; dues $12.00/year in No America, elsewhere $20.00/year; sample bulletin $1.00 in No America, elsewhere 5 IRCs.
****

Some members of the * MIAMI VALLEY DX CLUB * are trying to organize a 2-meter ham net for sharing SWL information in the central/southwest Ohio area, using the Fairfield Amateur Radio Assn. repeater (145.39/145.19 MHz). Interested in contributing? Contact Dave Hammer (4666 Larkhall Lane, Columbus, OH 43229 USA)... Fred Vobbe's guide to remote broadcast pick-up units; Mark Lucas' review of solar/geo-magnetic weather during February; and highlights of upcoming programs on Radio Netherlands and the BBC - that's some of what's in the March issue of "DX World"...
MVDXC address: 4666 Larkhall Lane, Columbus, OH 43229 USA; dues US$8.00/year; sample bulletin $1 in No America, elsewhere 3 IRCs.
****

See the * MICHIGAN AREA RADIO ENTHUSIASTS'* "Member's Newsletter" (Feb/March) for Bob Walker's review of two booklets aimed at people just getting into shortwave listening: "The World is Yours" by Samuel

Alcorn (US$5.95 + p/h from Gilfer Shortwave, 52 Park Ave., Park Ridge, NJ 07656 USA) and "Introducing International Radio" by Kenneth MacHarg (US$3.95 + p/h from Global Village Press, Box 1345, Jeffersonville, IN 47131) USA...
MARE address: P.O. Box 311, Wixom, MI 48096 USA; dues USA $7.50/year, Canada US$8.50; sample bulletin $1 in No America, elsewhere 3 IRCs.
****

It's been a busy month for the * MINNESOTA DX CLUB *. On March 10th they got a tour of the Northwest Air Maintenance Base at the Minneapolis airport; March 18-19 they had a DXpedition at Camp Omega. ...MDXC's next meeting will be 7:00 p.m. on April 14th at Todd Skaine's apartment (2024 Grand Ave. So., #3, Minneapolis)...
MDXC address: 5212 Drew Avenue South, Minneapolis, MN 55410 USA; dues: $10.00/year (membership limited to residents of Minnesota & western Wisconsin.
****

The * NATIONAL RADIO CLUB's * "DX News" may ignore April Fools Day, but not their DX Audio Service. One side of April's 90-minute cassette will be devoted to "parodies, actual spoofs on the air and much other side-splitting stuff," according to publisher Mike Knitter. Price: US$3 (overseas US$5), from DXAS, P.O. Box 24, Cambridge, WI 53523 USA. You can also charge it to your Visa or Mastercard account by calling 608-423-4159 between 7 and 11 p.m. Eastern Local Time - no collect calls, please... Mike's surprised by how many people order NRC products on their credit cards - and how many express appreciation for this option. Other clubs might take note...
NRC address: P.O. Box 118, Poquonock, CT 06064 USA; dues USA $24.00/year, Canada $25.00/year, elsewhere write to club; sample bulletin $1 in No America, elsewhere 3 IRCs.
****

INCLUSION is the new byword, per "An Open Letter to the NASWA Membership" from Chuck Rippel, the * NORTH AMERICAN SHORT WAVE ASSN.'s * Executive Director: "I would like to see NASWA welcome, encourage, and include as many individuals, regional groups and clubs as might wish to participate... For DXers, plan to see an increased level of cooperation between us and some of the weekly DX bulletins. The needs of the listening enthusiast have equal merit and importance. There are items in the planning stages to better recognize and meet those needs." ...Tom Sundstrom, compiler of NASWA's monthly list of English-language broadcasts, now has a fax machine on a dedicated phoneline to receive updates, loggings for the ANARC SWL Net, and other messages: 609-859-3226 in New Jersey... Our SWL Net Moderator, Bob Brown, KW3F, is the new editor of "Log Section A" in FRENDX, covering 2000-4899 kHz...
NASWA address: 45 Wildflower Road, Levittown, PA 19057 USA; dues $18.00/year worldwide by surface mail (for airmail delivery of bulletin, write to club); sample bulletin $1 in No America, elsewhere

5 IRCs.
****

"The Bob Maclean Show," distributed by Canada's CKO News and Information Radio, has a new biweekly feature: a 15-minute discussion of shortwave listening with Steve Canney, the * ONTARIO DX ASSN.'s * Special Events Coordinator. The scheduled airtimes are 10:10 a.m. local time on FM stations in Toronto (99.1), London (97.5), Ottawa (106.9), Halifax (103.5), and on an AM station in Montreal (1470 kHz). Upcoming air-dates are April 7 & 21, May 5 & 19. There are several repeat broadcasts on the weekends following, in Vancouver (96.1), Edmonton (101.9) and Calgary (103.1)... The "DXChange," ODXA's new telephone message service, is now open. Anyone can call 416-299-ODXA in Scarborough, Ont., leave a voice message up to 4 minutes long, and hear a frequently updated selection of messages left by other callers and the system host, John Grimley...
ODXA address: P.O. Box 161, Station A, Willowdale, ON, M5N 2S8 Canada (USA membership agent: Harold Riddell, 2844 S. Union, Rochester, NY 14624 USA); dues $20.00/year for USA, CN$25.00/year in Canada, US$26.00/year or CN$33.00/year elsewhere; sample bulletin $2 or 4 IRCs.
****

The * RADIO COMMUNICATIONS MONITORING ASSN. * has a new ANARC Representative: Chuck Smith... Some improvements are coming to the "RCMA Newsletter": the "Aircraft" column's coverage is being expanded to include the UHF military air band, and starting next month, all book and publication reviews will be grouped together in a single section...
RCMA address: P.O. Box 542, Silverado, CA 92676 USA; dues $18.50/year USA, elsewhere $22.50/year; sample bulletin $1.50 in No America, elsewhere 6 IRCs.
****

It can't happen here? Paul Lannuier's "Utility Scene" column in the March * SPEEDX * cites a report in the English magazine "New Statesman & Society" (16 Dec 88) about five British radio Amateurs who were fined and threatened with jail for monitoring SW utility transmissions. They were caught after being heard exchanging frequencies over the air. "The article stresses that the attention this case is getting will most likely inspire more people to commit the 'crime' of utility DXing, and at the same time warn them to be a little more careful about exchanging information with fellow hobbyists," Paul adds... The 3rd edition of the "USSR Merchant Ship List" is now available: US$6 post-paid (US$7.50 overseas) from Jason Berri, 21240 S. Western Ave., Apt. 18, Torrance CA 90501 USA...
SPEEDX address: P.O. Box 196, DuBois, PA 15801-0196 USA; dues $20.00/year worldwide for surface delivery of bulletin (write to club for airmail rates); sample bulletin $1.50 in No America, elsewhere 8 IRCs.
****

Don't miss "The Nature of DX - Part IV" by Tim McVey, in the March issue of the * WORLDWIDE TV-FM DX ASSN.'s * newsletter. Superbly written/illustrated, his topic is modes of VHF/UHF reflection by the ionosphere. Next month's installment is on meteor and auroral reflection... Speaking of meteors, by tuning to one locally-unoccupied FM broadcast channel (101.1 MHz) for months at a stretch, Ralph Strobel has caught and identified 19 distant stations briefly reflected by meteor-trails. None were east of his home in Indiana, and he wonders why (so do we)...
WTFDA address: P.O. Box 514, Buffalo, NY 14205 USA; US dues $17.00/year, Canada US$18, elsewhere $27.00; sample bulletin $1 in No America, elsewhere 6 IRCs.
.....

CLUBSCAN is a monthly feature of the ANARC Newsletter. Subscriptions to the Newsletter are $8/year to US addresses; US$8.50 to Canada/ Mexico; US$13 elsewhere. Order from: ANARC Publications, P.O. Box 462, Northfield, MN 55057 USA.

204. Conflicting PRO-2004 mods?

Newsgroup: rec.ham-radio
Date: 1989-03-27 06:43:09 UTC
From: jimkirk@OUTLAW.UWYO.EDU
Message-ID: <890326234309.2020065c@UWYO.BITNET>
Source record: 19475

Over the years, several Pro-2004 mods have been posted. One topic is speeding up the scan rate, but one mod involves changing the master clock frequency for the microprocessor while another involves inserting diode D514. Could somebody clarify whether one mod is better than the other, or whether either causes undesirable side-effects? It seems eminently more practical to insert the diode yet the resonator change is posted much more frequently.

JK

205. FCC going after satellite pirates

Newsgroup: rec.ham-radio

>million from the previous year's appropriation. The increased funding
>would help the agency's continuing crackdown on enforcement in such areas
>as satellite signal piracy.
^^^^^^^^^^^^^^^^^^^^^^^^

Is the FCC just going after commercial pirates such as bars, motels and sleazy SMATV cable companies or are they out to get private backyard dish owners too ? How can they tell whether or not one is watching a legal public service on ones backyard dish and not descrambling something one is not supposed to ? It doesn't seem to me that a modern block converting TVRO would radiate much of a tattletail signature as the first LO is fixed (usually a dielectric resonator oscillator) and not modulated by the AFC circuit. ? Are they planning to use VHF radiation from the videocipher and TV ? Or can they barge into your living room on suspicion ?

Or is the satellite signal piracy problem for which they need an extra $10 Million mostly a problem with other satellite services such as financial data transmissions and those incredibly unsecure FM-FDM-SSB telephone circuits which haven't yet been completely phased out.

Does anybody know anything more ?

206. Getting Started (for Mark Rosenstein)

Newsgroup: rec.ham-radio
Date: 1989-03-27 12:17:46 UTC
From: Michael_Edelman%Wayne-MTS@MAILGW.CC.UMICH.EDU
Message-ID: <129500@Wayne-MTS>
Source record: 19336

Having just Elmered my friend KB8GHY through his Novice and Tech exams (And hopefully his general in a week) I recommend the ARRL package, which I believe is called "Getting Started in Amateur Radio". Book and cassette are about $15; book alone is less.

It's very clear and informative, as has everything you need includinga FCC form 610.
73 de KA8OSZ (I shoulda changed that call long ago...)

207. Suggestions, Anyone?

I'm a firm believer in cheap gear, though I admit to often breaking
the rule. But...let me suggest the following:

HF gear: I do have a Kenwood 140, but I'm looking for a 120 or 130
for a mobile rig and backup. These superb little boxes go for less
than $300 used. So what if there's no general coverage or FM? They
cost less than *half* of what the cheapest new rigs cost.

I also have my eye on some used Colling S-line gear. First of all,
it's *real* radio gear- you gotta tune the finals, eh? It's also
state of the (tube) art and *cheeep*! Last swap a friend picked up
a pair for $425, total. You can get a pair of late-model S-3C's
for around $1500, which is about mid-rand for gear these days. And
few of the new solid state rigs have as good a reciever as an S-line.

VHF: I do have a lot of these...but among my favorites are my Icom
215A and my Regency HR-2B. The 215A (and its cheaper predecessor, the
211) are popular around here for budget all-mode and packet. They usually
run $250-$290 depending on model. The Regency is a great rig- rock-bound
FM and great audio. New, these were $400+, I'm told. Today they're
generally around $50 or less. I paid $35 for mine at the last swap. Add
a few bucks for crystals (about $4.20 + p&h from JAN) and you're on the
air. I'm told they're pretty good for packet.
Accessories: You need a tuner and SWR meter. Buy the meter, and hunt the
swaps for two big capacitors and a rotary inductor. Or get a big wafer
switch and some 12 ga wire and brew your own. It's pretty non-critical.

And don't forget:

24 clock set to GMT, station log, thick copper braid for station ground,
a better speaker than the one that comes in your rig (try an 8" Quam
aircraft communications speaker- about $15; you supply the box), and a good
ground rod or two. Or more.

> RS-232 devices... it lists for $90 U.S.! Dealer discount
> knocks it down to $65... but that is still exorbitant.
> Does Anyone out there have the schematic for this critter?
> I would like to just build it myself, if I can.

ICOM is crazy to be selling this interface for $90. They sell the "satelite" interface for less money, and that has a CPU in it!!!

Enough complaining.. here is the description of a *SIMPLE* circuit that I have been using for a while... I am at work, and don't have the schematics here, so I will not try and give pin numbers, etc.

Using a MAXIM (manufacturer) MAX-232 (this is a single chip RS-232 to TTL level converter), "construct" the circuit as defined in the manufacturers specifications. It only needs a few capacitors. The chip is powered by a single +5 VDC. To obtain this voltage, I used a 78L05 voltage regulator (8-30 volts in, perfect for use with +12V in!!).

Connect the RS-232 level pins to your computer, most only need RXD and TXD. I tied the other handshaking pins so they will be TRUE all the time (DCD, DSR, etc).

The TTL level RXD and TXD are simple wired-or together (short together), and this is connected to the ICOM "remote" connector tip, the ring goes to the TTL ground.

This circuit has been working fine for me... I believe a copy of a similar circuit is in the manual for the ICOM IC-275 (I forget whether it is in the service manual or the owners manual)...

Hope this helps,

Rich, NM1D

WARNING ! WARNING ! WARNING !

From: WA2SQQ Bob Kozlarek
Subject: Software Virus
PKZIP/PKUNZIP .92
AM40/AM41

Recent developments in the software world have required the famous PKARC software to be replaced by a new version called PKZIP/PKUNZIP.

While several versions have been seen, the latest appears to be version .92 . Usually listed on landline BBS's is a program which will provide a menu driven screen for PKZIP, usually listed as AM-40 or AM-41.

After running these one time, the embedded virus allocated 13 meg of memory to "never never land". It appears that this "strain" looks to see how much memory is occupied on the HD and then proceeds to gobble up an equal amount of unused memory. The results are devastating if you have more than 50% of the drives capacity in use. With the assistance of Gary WA2BAU I was able to retrieve the lost memory by using CHKDSK /f. For those of you who are not familiar with this DOS command, drop me a line @KD6TH and I'll elaborate. My sincere thanks goes out to Gary WA2BAU for saving me lots of disk handling ! Please pass this on to your local BBS and be sure to include the remedy.

Further to N2EZG's bulletin on constructing an adapter for the modem socket to improve the performance of Tiny-2 (and Micropower-2) TNCs that have become "hard of hearing": Gwyn, W1BEL, of PacComm advises that those not wanting to roll their own can call and they'll send an adapter, free of charge. Not all of the TNCs exhibit the problem, and recent revs of the TNC boards already have the mod (which inverts the phase of a clock signal) in place, so don't bother unless you are actually noticing degradation of the modem performance.

From: WMartin@WSMR-SIMTEL20.ARMY.MIL
Message-ID: <12481372446.26.WMARTIN@WSMR-SIMTEL20>
Source record: 19345

Some years ago, there were items in the DX and SWL press and on related broadcasts, and also in general-interest magazines like TIME and TV GUIDE on the then-chaotic situation in Italy regarding broadcasting. As I recall, it was caused by the fact that broadcasting was a state monopoly for many years, but then a court decision threw out the state's authority to limit or regulate private broadcasting. Immediately thereafter, dozens of radio and TV broadcasters started up private stations; I believe there was no frequency coordination, so they walked all over each other. There was also no limits on the subjects being broadcast, so a lot of pornography, live sex shows, and the like was aired. This was what attracted the attention of the US media, of course. However, I never did hear any followups to this. What eventually happened? I get the impression that Italian broadcasting is now like most of Europe, with a mix of state-run and private commercial broadcasters, and that the wild times of a few years ago no longer exist. Can anyone post a summary of just what happened?

Regards, Will Martin

Source record: 19332

Some time ago I posted to the net a question on how to get recieve on the LW band (~130-370khz) on my Akai AAR32 stereo reciever. Now that I have a copy of the service manual, I can answer my own question. It turns out that, on the control board, I could clip a diode. But I would have to install a big handful of new LC circuits and analog switching circuits to actually recieve something (i.e. it ain't worth all this trouble, besides I might mess up the existing radio circuits!). This stuff exists on the European version of this radio. By clipping another diode, I could make the FM tuner increment or decrement by 50khz instead of 100khz, but that is a rather pointless mod, as FM BC stations are channelized on every 200khz. It doesn't look like there are any mods I can do that will yield something useful. Oh well... 73 de WA2ISE

> lead. Does anyone know what this number is? Seems regular twin-lead is
> around .88 I'm guessing the foam stuff will be a lower number.

Gosh, this certainly will depend on just how it's made. I'd first try
to get a spec from the manufacturer. Failing that (or maybe even in
addition, as a confirmation) I'd make up a section of it shorted at one
end and open at the other and see where it resonated. If you know the
foam material and density and the geometry, you could calculate it, but
that's probably going to be tough. Actually, you might even be able to
figure it out from the wire size and spacing and make the assumption that
it is indeed 300 ohms -- but the resonant frequency measurement will
probably be the best way...

> As long as we're (I'm) discussing velocity factors...how about PVC pipe?
> If one builds this twin-lead J-POLE and then slips it into a length of
> 1/2" PVC (sched 40) how much should he adjust the length of the twin-lead
> to compensate ?

Can you do this the same way? Slip a stub in the pipe and measure its
resonant frequency. Compare with its length. I'd be more worried,
however, about the losses in PVC pipe. I've heard that it's pretty bad
at VHF and above -- maybe even at HF. I've always found other ways to
support my antennas, so I have no first-hand knowledge about PVC's
characteristics.

Hope this helps!

The Winnebiko III Project Needs YOU!
March 24, 1989

Help!

I have a problem. As you may have read elsewhere on the nets or in various magazines, I'm in the process of rebuilding the Winnebiko -- the computerized, solar-powered, recumbent bicycle that has already carried me 16,000 miles around the US. The new system is intended for open-ended international travel, with enough on-board computation, communication, and power-generation resources to make its location on the planet essentially irrelevant.

The design is developing well, and numerous subsystems are arising from the clutter of my temporary lab here in the wilds of Silicon Valley. But I've come to realize that hitting the road in this decade requires more manpower: wizards of all types, machinists, technicians, programmers, design engineers, PC fab houses, RF magicians, project-management heavies, and even a few crank-turners. I've bitten off a big one, and if I try to finish it alone I'll be old and fat by the time I return to the road (and the parts of the system finished first will already be obsolete!).

Are you interested in hands-on involvement with the Winnebiko? There's no direct cash in it, but there ARE some distinct benefits...

--> First and foremost, FUN. This continues to be the bottom line: that fundamental passion that makes our eyes light up at new gizmology, triggers dreams of future systems, and makes the whole idea of a computerized bicycle with real-time aerodynamic modeling, live mapping, navigation, CAD, solar power, regenerative braking, a handlebar keyboard, speech I/O, and a satellite earth station seem endlessly alluring. There is a delicious feeling of conquering steep learning curves,

applying creative skills across a wide range of specialties, beating trade-offs by inventing new rules or breaking old ones, and generally exercising the brain -- for this project is unlike most work in industry in that cost is no object. We have over 100 corporate equipment sponsors, habitually choose the best of everything, and remind ourselves constantly that this is art as well as engineering.

--> Second, there's glory in it. The system has spawned hundreds of magazine articles over the years, and I'm always happy to share the spotlight with those who have had a creative role in the design. If you're on a competitive career track, publication credits will dramatically spice up your resume; if you're looking for exposure, a few well-placed mentions are worth infinitely more than paid ads.

--> Third, there's strong potential for indirect money in it. This comes from two sources: product spinoffs and consulting gigs. A number of these subsystems have potential in environments other than compu-bikes, and I'm starting to build joint ventures to get a few of them into the market before someone beats us to it. And consulting deals come my way constantly -- instead of my usual mumbled, "uh, no, I'm too busy," I now refer clients to the people who have proven their wizardry on related projects. One fellow has billed almost $50K in the last year as a result of such leads; another is just now bootstrapping himself into full-time freelancing on the strength of CAA referrals.

--> Finally, there are all those other little things that add up. The Winnebiko design team (an ad-hocracy called Nomadic Research Labs) is a wild, networked community of kindred spirits: making contacts like this can have far-reaching consequences. You'll be kept current on the adventure, receiving a copy of my book and a free subscription the the Journal. And you just might be invited to trash your lifestyle and go for a long bike ride.......

The Winnebiko III

Before outlining specific projects I need help on, I should give you an overview of the new machine. After 16,000 miles, a number of deficiencies in the existing design have become apparent -- most notably architectural inflexibility as evidenced by the hardwired front panel. I'm tired of editing with a soldering iron, and the design is frozen in 1985 technology.

The key to the new structure is a "resource bus" controlled by a 68000 running FORTH. This is the bicycle control processor (BCP), responsible for active management of everything on board via a SCSI bus, I/O processor, and a few high-speed serial links. The SCSI channel is expanded into a novel I/O structure that consists

primarily of 128-point crosspoint matrices: Mitel parts that toggle an array of FETs as dictated by a field of RAM. Through these pass all serial, analog, and audio information on the bike.

Other I/O is more traditional, tying to a standard I/O expansion bus. The effect of all of this, stepping back one level of abstraction, is a five "channel" bus (power, serial, audio, analog, data) that links the following devices in any imaginable combination:

speech synthesizer low-power packet TNC
all-mode RF data system UHF transceiver (business)
2-meter VHF transceiver UHF transceiver (ham, sat)
10-meter all-mode transceiver cellular phone
cellular phone modem DTMF transceiver
analog mux (with quad-slope D-A) fax and modem board
console printer/plotter HF ham transceiver
GPS nav receiver with temp LORAN auto transmission logic
286/386 DOS engine security system and pager
audio cassette recorder entertainment electronics
bike instrumentation package 49 MHz full duplex base unit
speech I/O subsystem utility I/O board
audio processing board MIDI system
console DB-9 speakers and helmet headset
switched loads such as lights the BCP itself

Some of the interconnections, of course, would be absurd -- but consider some of the possibilities: Mobile phone patch between 10-meter ham QSO with Japan and cellular phone. Reconfiguration of packet datacomm to allow full remote console operations from manpack-laptop via UHF data link. Logging and diagnostics to disk file or console printer. Remote touch-tone commands to transmit local audio on 49 MHz or any other RF channel. Logging on to DIALOG and doing research while mobile. Introduction of audio filtering and other functions to enhance any communication mode. Synthesized security alerts that beacon the bike's exact coordinates on ham frequencies (or celphone 911) if it's ever moved without the correct password. Etcetera...

On top of all this, there are two DOS environments -- one a robust 286/386 for the CAD applications and computer-generated maps from CDROM, the other a low-power V40-class board for basic editing. These share a 40 Meg hard disk through a LAN and present the basic operating environment beyond the FORTH that actually runs the bike systems.

Two large console LCDs provide the bulk of the user interface, with a heads-up display a distinct possibility. A 640 X 480 VGA backlit DST LCD from Sharp is the main graphics display, but it requires a 2.5 watt backlight. When this is a drain on the power budget, the DOS systems can request a reflective super-twist 640 X 200 normally owned by the BCP. The HUD, if it happens, can be used by any system -- primarily for text, database, and map graphics from

CDROM and GPS data. Incidentally, the large display will be set behind a surface acoustic wave touchscreen to help support interaction with the mapping package (point to "contact" icon for a pop-up text box with corresponding database contents).

Speaking of power, there are 6 18-watt solar panels on the trailer, and 10 watts on the bike. These are bussed together to feed an array of switching power supplies associated with each battery, the status of which is actively metered by the BCP. The processor decides which battery bus is assigned to each load bus, switching them dynamically through a heuristic algorithm that attempts to track usage patterns and prevent loss of power on a dark night ride. The fallback position here is a variable-reluctance motor/generator embedded in the new rear hub, capable of sourcing enough power to run everything if I'm willing to put out the human effort. (Dynamic braking, by the way, is automatic -- a pot in the brake lever invokes this process invisibly before the hydraulic disc kicks in.)

Communications includes cellular phone with modem as well as a very robust ham station. The most interesting part of this is the OSCAR satellite station (modes B & J), which uses a collapsible antenna and a pair of multimode transceivers to uplink 435 MHz through 12 dbdc gain and downlink 145 through 10 db and a preamp (or the inverse). Supporting this is software in the PC that integrates orbital elements into a real-time graphic display of satellite location and footprint, along with AZ-EL-Range data. I do have to stop the bike for this, of course -- the beam array when extended is almost 9 feet long.

The BCP keeps busy doing things besides managing the bus and dealing with the handlebar keyboard and mouse -- it also controls the bike's new automatic transmission. Monitoring speed, cadence, torque, heart rate, and a subjective "wimp factor" keyed in at any time that indicates robustness of the engine, the system manages three Browning derailleurs covering 36 separate ratios. This seems a step backward from my existing 54 speeds, but of those, I use less than half. The key is range, provided equally well by the new automatic system.

There's more, but it gets progressively more detailed. Suffice it to say that the overall intent is to expand upon the existing theme of my "high-tech nomadics" -- maximum communication and computation ability without any geographic or utility support requirements. The obvious practical reason is the enabling of open-ended freelance writing and consulting without concern for location (linked via a web of networks to base office and publishers, powered by the sun, etc.) The originally unintended spinoff is a growing set of relationships with sponsoring companies, many of which are now becoming involved in technology-transfer joint ventures as the importance of some of these systems becomes interesting to a wider segment of the population than computerized cyclists. And, of

course, it is demonstrating through extensive ongoing media coverage a host of exciting new technologies... all flavored by fun and adventure that often seems too good to be true. The public loves it, while learning something at the same time.

The Project Potential

There are dozens of subsystems, custom parts, circuit boards, programs, packaging challenges, and various other system components that have to work together before the Winnebiko III can roll. Do any of these make your soldering iron, CAD system, or milling machine itch?

The transmission control system: linking speed, torque, cadence, and cardiac sensors to a dedicated micro under BCP management, and developing the algorithm that will learn from observation of my own shifting patterns under varying conditions. Output is six bits that control a trio of Browning transmissions.

Virtual front panel control for HF and satellite transceivers: using a micro to replace hardware front panels and present virtual radio consoles to the BCP screen. This may requires hacking of radio I/O logic, with the processor sleeping between commands to minimize RFI.

The solar/battery manager: processor control of the entire charging and power-distribution function, including interface with custom switching power supplies (under construction) and a quad-slope A-D scanning system voltage and current values. This subsystem should include full profiling of battery performance to aid in resource management.

CDROM-based mapping from GPS input: Nav data must be integrated with map data to produce a real-time wireframe model of surrounding areas, keyed by lat-long-el data to the database on hard disk. This is a big one. Subprojects here include GPS implementation, hooks into the map software, and the possibility of using a serious graphics engine to do the crunching.

Regenerative braking controller, working with the variable reluctance motor inventors and the battery management team. A bonus here is the potential for assigning the 118 watts of solar capacity to the motor for a small power assist (though I won't have enough battery to run the bike on electric power).

Trailer brake system: using a spring-extend double-acting cylinder built into the hitch and a pair of Mathauser hydraulic brakes, reduce the effective load of the trailer during braking to about 10% of its normal value.

Heads-up display system: helmet-mounted LCD with associated optics and backlight (optional), perhaps with a steerable optical path to accommodate microfiche maps as well.

Improved handlebar keyboard: waterproof, fast binary keyboard with thumb mouse or other pointing device and a few other controls. Must be ergonomically optimized and non-interfering with mechanical hardware... and must work well with the MIDI system in flute-emulation mode.

Forward Reconnaissance Unit: This will only happen if the CAA team expands to include a nomad with spare cargo capacity, but it's interesting. Basically an RC plane with live video transmission via ATV channels back to a Walkman display. We're looking at the new Philips camera and AEA ATV boards, which have other applications on the bike as well.

Audio matrix system: Based on the Mitel array and a replicated normalization amp, this allows processor-controlled interconnection of any number of audio sources and sinks. Best accomplished as PC board, since the 32X32 array has an identical amp circuit on every I/O line.

Packaging projects: Beam antenna drawer, hard disk shock mounting, satcom area, and a variety of other attempts to protect delicate equipment in a brutal environment without robbing it of utility or making it too heavy.

Trailer system, mechanical: New trailer design with solar roof, battery compartment, RF and power cabling, and integration of related subsystems like brakes and antenna mast components.

Manpack system: DOS laptop with small solar panel, UHF packet system, and full duplex audio/video links. Must be rugged and waterproof... and it happens to be a model for a future commercial personal RF mailbox product.

Antenna system: With the help of KLM, Larsen, and Telex, optimize HF, satellite, VHF, UHF, and cellular antennas for minimum weight and maximum utilization of shared cabling. Satellite GaAsFET preamps must be protected from transmitted RF.

Video and Mini OCR system: CCD video to character recognition software... as well as to the FAX board (with suitable scan conversion). Same components transmit bike video to remote.

MIDI system: start with commercial MIDI products (Yamaha DX100 and Breakaway's Vocalizer) and interface to the bus, removing standard keyboard and control panel and replacing with virtual ones driven by handlebar keyboard, voice input, and sequencer software.

Peltier-based water server: Derive surplus solar or regen braking power and cool a Melcor thermoelectric device in a baffled water reservoir. A second Peltier device goes in the helmet for active body cooling on hot days, pumping heat out through a heat sink in the airstream.

Software to accept scanned or other input and create bitmap images for output to the console graphics printer. These are primarily for on-the-road sponsor referrals.

Countless other software projects, ranging from FORTH tasks to dynamic airflow modeling. The environment consists of three DOS platforms, the 68000 FORTH system, an I/O processor, a high-speed array processor, and a half-dozen dedicated micros on the network. I assume a laptop Mac will provide biketop publishing capability by 1990.

Various mechanical projects as well: hydraulic rear disk brake, heavy duty headset bearing, new steering bearing, flip-down service/work stand for the whole bike, utility boxes, rear enclosure, etcetera.

... and so on. There are enough projects here to keep a whole party of creative people happy for months. If this were a company with a production deadline, I'd panic... as it is, I keep reminding myself that the bottom line is fun and this is artwork, not business. With that in mind, how do you feel about getting involved?

I can be reached most anytime at 408-263-0660. The address at this temporary Silicon Valley layover is 98 Sudbury Drive, Milpitas, CA 95035. Network addresses are:

Based on my experience, there may be some geographic variation in HRO stores. Much of my equipment has come from HRO in Burlingame, California. I have had none of the problems described in the last few notes. My Kenwood 621 worked correctly when I bought it and continues to do so. When I had equipment fail under warranty, or received a Larsen antenna that was manufactured containing a defect, the equipment was replaced promptly with new stuff, with no questions.

I do take the time to get to know the guys who work there, many of the staff are part time help and work there because they enjoy doing it (and work in some other technology based industry during the week). Have you considered a well phrased letter to the head of the company? It would be a lot more effective than posting here.

We had the same thing happen to us, (it was a misguided remote base...).
We found that a reasonable quick and dirty approach was an HT inside
the car with either the duck removed or a ??db attenuator inserted
could be used. It seems that the signal could make it through the
wide front windshield much better than through any of the side windows.
So you turn the car in a circle until you get the strongest signal and
then drive in that direction. The signal will suddenly drop as you
pass it (ie. as it becomes even with the side of the car.). You then
take another reading and continue. As you get close you may have to
remove the duck and maybe even shield the HT with your body to get
enough attenuation.

Have fun!

Oh, come now. As I a retired police dispatcher I can assure you that the sole purpose of such legislation to keep people from butchering one another on the public highways. Your vision of malevolent officials sitting around inventing ways to "harrass" freedom loving citizens is sophomoric!

Ever been to a hospital ER and see the mangled bodies brought in to be put back together and/or put on ice for next of kin to identify? That will straighten you out in a hurry -- flat on the floor in dead faint.

Not totally accurate. What the laser tag is used for is to locate the target, whose coordinates are memorized by the guidance system computer of the aircraft. This information can be used for two different tasks. The first is to guide the airplane back to that spot later in the event the pilot has something else to do first. IF the pilot decides he wants to shoot at it, he can use the information for his gatlings, rockets or whatever. He is warned if the tag was stronger than would be expected from a reflection.

Incidentally, the equipment for doing all this is so hush-hush that when the aircraft lands it is intercepted on the tarmac by security police armed with machineguns and an electronic warefare technician. The latter removes the IR gear and immediately locks it in a safe.

Sb: DISCOVERY/UFO?
Fm: Bert 71450,3504
To: ALL

I just received a rather remarkable phone call from Bob Oechsler, MUFON investigator from Annapolis, MD, who also has his own nationally broadcast UFO radio talk show. Bob asked me to upload the following information.

On Tuesday March 14, 1989 at 6:42 am the following message was received by a UFO investigator in Baltimore through WA3NAN (Goddard) amateur radio transission from the orbiter Discovery. "Houston, this is Discovery. We still have the alien space craft, uhh, under observance." The transmission was picked up on a Radio Shack scanner tuned to 147.45 mhz.

According to Bob, he and his colleagues have found that the transmission matches up with NASA tapes except that there is a "blank space" in the tape where the above transmission occurred. (Possibly bleached out?) They are currently doing voice print analyis in an effort to match the specific voice with one of the astronauts. They will compare to voices of all of the astronauts recorded during the Today Show interview. They should know "for sure" in about a week.

Bob would very much appreciate it if anyone who may be able to corroborate this transmission would call him at 301-798-1503. About 15 minutes prior to the transmission there was a broadcast about "a fire on board". There is speculation that this may have been a code to switch frequencies or to stop feed to the public domain. He would this also like to hear if anyone can corroborate anything about a "fire."

227. Bold New Move from FCC

Newsgroup: rec.ham-radio
Date: 1989-03-27 21:35:29 UTC
From: chris@hplvli.HP.COM
Message-ID: <4590019@hplvli.HP.COM>
Source record: 19343

License-Free Code Proposed by FCC

Dateline: Washington, DC -- April 1, 1989

In a bold new move aimed at calming both camps in the
code-free license debate, the FCC announced today
that it is considering allowing the use of A1A (international
telegraphy code) without the need for formal licensing.

FCC spokeswoman Ima Joshin, speaking on conditions of
anonymity, said that the new license-free code would
satisfy the "conservatives" who desire to maintain
a CW proficiency requirement, since the use of the new
privileges would imply de-facto CW proficiency on the
part of it's practicioners.
At the same time, by eliminating the need for a formal
licensing examination, it will encourage everybody to
try the new privileges, thus opening the doors of
ham radio to the growth many "liberal"
no-code proponents believe is needed.

The new privileges would be available to all US Citizens
holding a Social Security Number, but are not without some
restrictions. Social Security Numbers would replace the call letters
which would not be issued to these users, and only certain
radio frequency bands would be available for this use.
Transmitter output power would be limited to 73 watts,
but this low power level would be compensated for by
the expected flood of innovative antenna designs coming from
the new communicators.

Three radio frequency bands are proposed for use under the
new license, 170-175 kHz, 26.965-27.405 MHz, and 220-222 MHz.
The last band announced, 220-222 MHz, came as a surprise to
almost everyone, as this band was formerly allocated to the
amateur radio service until it was
bought by the Untied Parcel Shippers company last year.
When asked about the apparent about-face on the part of the
commission, Ms Joshin had little comment, and would only say
that, "The company found that it's older 23
and 40 channel radios would not go up that high".

In a related move, the FCC also proposed a new code-free
license, based on the present Amateur Radio Service
written exams.
The license would have 5 proficiency levels, designated

only by the letters N, T, G, A and E.
No telegraphy examination would be required for the license,
and all levels above N carry only "endorsement" status.

The new license grants no transmitting privileges whatsoever,
but the FCC will send each successful applicant an official,
sumdged and barely-readable certificate, suitable for framing,
which certifies that the applicant successfully passed the
written examination, and probably could have passed the CW
test if he had taken it, but that his moral principles
prevented him from considering CW as a modern mode of communications.

Ladies and Gentlemen of the net:

I have a terrible problem...my RCA BTA 50-J AM transmitter just ate one of its MC899 logic chips. Fortunately for me, I could adapt this circuit to use TTL (works, too at 3.6 volts) but there are plenty more of these beasties which depend on the characteristics of this family for waveshaping, etc.

The logic chips are part of the "Ampliphase" exciter modulator card (as opposed to the drive regulator, oscillator, and reflectometer which are not nearly as packed with DTL). A triangle wave is generated inside which is summed with the incoming audio, and then "clipped" to form pulses of variable width and hence phase (and hence Ampliphase at the antenna output...).

Are there sources (even MIL/JAN parts are fine) for MC-8xx family spares? RCA-GE doesn't have them. If this exciter were to lose another one, I'd have to convert it back to its vacuum tube counterpart (blecch, hock-ptewey).

Of course, if you have a "spare" BTE-20 exciter gathering dust in your junk box, I'd be interested in that, too. My transmitter came from WHN New York (now WFAN) but the "broker" swiped the second exciter and the spares.

Yours for $5000/mo power bills,

York David Anthony

From: judice@kyoa.DEC.COM
Message-ID: <8903280218.AA05146@decwrl.dec.com>
Source record: 19352

I think the Kenwood RZ-1 is neat in concept, though I recognize some
of the shortcomings listed with respect to programming ease of use, etc.
Anyone have any reports on actual performance?

Another interesting point... The RZ-1 theoretically cannot be installed
legally in a vehicle in a state like New Jersey, which prohibits mobile
scanners. Of course, who would know, since it looks like an ordinary
in dash car stereo... :)

BTW, what antenna system - particularly in a mobile system - would provide
the wideband coverage this device would need?

Thanks,
Lou

Subject: IR Radar (LIDAR)

Chris Novy writes....
>If people would do the speed limit, they wouldn't have to worry about radar.

True, except for...

(1) Most speed limits are *arbitrarily* set (i.e., 55 National Maximum
Speed Limit) without regard to road or traffic engineering considerations.
Do you really think that 55 is the safest top speed on, say, I-10 between
El Paso and San Antonio? (Or pick your favorite stretch of endless
Interstate if you don't like that one)

(2) As Chris says, inaccurate usage of the radar unit by the user (i.e.,
clocking the wrong vehicle).

(3) Inaccurate calibration of the unit (it does happen - remember the
trees that were clocked at 85 MPH?).

There is an organization that promotes safe *and* rational traffic laws.
It's name is Citizens for Rational Traffic Laws. E-mail me for more
information on membership.

I get miffed every time I see the police citing perfectly good drivers
for being 5 MPH over an arbitrarily set speed limit when other, much more
serious crime demands attention.

I realize that this has moved completely out of the ham radio area, but I
just couldn't let that "speed kills" implication pass without comment.

>products.

>If anyone knows of a manufacturer for the amps them selves or a good
>places to get a wide range of coils, chokes, and cores, please send me
>mail.

You didn't mention any of the details of the power level involved. Do you want to drive with .001 watt to 1 watt out, 1 watt in to 100 out, 100 in to 2500 out?

Do you have preferences on the power supply form? While the power level often determines the preferred technology (tubes/transistors) do you have a preference? What duty cycle does the amp need?

Until people know if you are looking for a low power amplifier for instrumentation (such as signals too weak to feed into the oscilloscope directly), or a high power source for a nuclear magnetic resonance system, it is hard to make recommendations.

If you had communications in mind, I would have expected amplifiers to be easy to find.

236. Nicads & chargers - a query

Newsgroup: rec.ham-radio
Date: 1989-03-28 08:16:53 UTC
From: MATT@UKACRL.BITNET
Message-ID: <KPETERSEN.12481556916.BABYL@WSMR-SIMTEL20.ARMY.MIL>
Source record: 19177

Just wondered if anyone could 'enlighten' me on this...

I own an HT which uses 10 AA size nicads. There is no provision for
charging on the unit, so I have to remove the nicads to charge them.
My commercial charging unit has 4 AA positions, so I want to build
a constant-current charger for 10 nicads.

The nicads themselves are marked:
'Standard Charge 50ma for 16hrs'
'Rapid Charge 150ma for 5hrs'

So... does the charge rate increase by 10, as I will be charging 10
batteries? I think not. Also, I guess they will have to be in series?

Apologies to people if they think this isn't strictly 'ham-radio',
but people have been suggesting construction projects lately :)

240. Re: Police Lasers...?

Newsgroup: rec.ham-radio
Date: 1989-03-28 13:39:45 UTC
From: currier@romeo.cs.duke.edu
Message-ID: <13989@duke.cs.duke.edu>
Source record: 19372

Uhh...I'm confused here. Let me quote a few lines from a description
of an optically guided missile system:

The missile's guidance system homes on the scattering frequency of a laser
hitting a target. In other words, the missile does not see the laser beam.
Instead, when the laser beam hits a target and breaks up the missile sees
the beam breakup. <stuff deleted>

The missle can be guided by STANDARD LASER DESIGNATORS, carried by helicopters,
ground troops etc etc. Kinda hard to get target coordinates from a remote
laser system when the sensors are in the optics system of the missile, isn't
it?

Next point: "...surrounded by machine gun toting guards...locked in a
safe by an EW" (slight paraphrase here :-))

What system are you talking about? I flew Electronic Warfare missions
in EP-3E Orions for a couple of years courtesy of VQ-1, NAS Agana Guam.
We flew off the coast of Russia, Korea, and lots of other places.
We all had TS whatever clearances. We had state of the art hardware
aboard. Never saw any machine gun toting guards. :-) Phew!

We detted out of various bases, and saw many SR-71 flights. Never saw them
"blast out of the hanger, take off, fly mission, and roll straight back to
hanger to be covered up" like so many folks have said. Perhaps the
"machine gun toting guards" fall into this category? :-) :-)

Ok, Ok, so maybe I am jumping up and down a little. Please correct me
if I am wrong. BUT, ya gotta tell me where you saw these guards, and
EW techs....NOT where you read about it. :-)

Both Icom and Kenwood make headsets that can be adapted to about any radio. You might have to make an interface box to provide preamp or speech processing. they use an electret(sp.) element that needs at least 5 vdc. I drive a four speed and find that the headset is a distinct safty factor. (I haven't broken 1 mike cord on the stick shift!) note: in Mass. it is illegal to have both ears covered by earphones.

243. Trouble with Ham Radio Dealers

Newsgroup: rec.ham-radio
Date: 1989-03-28 14:49:00 UTC
From: ewb@raybed2.UUCP
Message-ID: <1290@raybed2.UUCP>
Source record: 19357
Cross-posted to: rec.ham-radio,rec.ham-radio.packet

I read with great interest the articles regarding trouble with some
of the ham radio dealers. What I did not see were any attempts to contact
the OWNER(S) of the store or chain of stores. I have a few suggestions on this
area which will probably lead to more satisfied customers.

If you go to a ham radio shop and receive gruff rude treatment or you
were just plain ignored, or you feel that you have been mis-treated
in any way, try talking to the store/branch manager. If that doesn't work,
WRITE OR CALL THE OWNER ! THEY WANT TO KNOW THIS STUFF. Most of the time
you can find their name(s) in adds in any of the major ham magazines.
The owners usually want to make it right and will in most cases go out
of their way to help you resolve a problem. Give them a try. Make
sure you have the info regarding the "incident" handy such as day, date,
time, person you dealt with, etc. They really do want your business
and do want to help.

As far as returns of radios that are broken, all of the dealers that
I do business with will take back an out-of-the-box bad radio within a
few days, some more than that. If you wonder about that, ASK UP FRONT.
If they say NO, then try to buy elsewhere. Also, a lot of the dealers will
try to match prices of other dealers. If you see a cheaper price somewhere
else bring in the add with you and ask if they will match the price or
do better on their prices. If not then you can always go somewhere else.
That is the Amercan way ! Any time you buy anything you should have your
questions answered up front so you can make a intelligent decision.

Motorola announced that they are about to release a new consumer-market
device that would allow any scanner to listen to scrambled communications.
The device connects to the audio output jack and will descramble any
type of scrambling scheme, either analog or digital. Suggested retail
price is $19.95. Batteries not included.

(It had to start sooner or later :-)

One day I turned on the cordless phone remote with the base unplugged and heard another phone that was randomly going off-hook, with short enough pulses that it was sometimes dialing. Usually got an intercept tone, but sometimes got a very confused person on the other end.

I grabbed the handheld scanner and set off in search of the errant base. The park across the street had one of the big metal trash dumpsters in it so I walked around it with the scanner noting signal min/max to get a general direction to set off in. About a block away I could hear the signal with the antenna off so I figured I must be close -- these are very low power xmitters -- so I found a normal sized metal trash can and ran the scanner around the outside of it. The opposite direction from the minimum signal pointed right at someone's door, bingo! (not really--I was off by one house, sigh :-( )

BTW, the guy who owned the phone had no idea that not only was it easy, but it was legal to listen to cordless phones--lets hear it for modern technology)

A few weeks back KB8GHY bought a Kenwood TH-21AT (I hope I have it right) from a dealer at a local swap. Brand new, and heavily discounted as it's discontinued- or that version is. The other day it suddenly quit- no output. Inspection revealed a few oddities: A diode that hand been hand soldered in, in contrast to the bulk of wave soldered parts; an RF choke that looked like it had been burned by the same operation that soldered in the diode, and a screw floating around in the case that may well have been responsible for frying the final.

The dealer (Michigan Radio) was very nice about the whole thing, and gave him a full credit on the HT towords a u2AT, and doing a similar deal on the Kenwood accessories for Icom accessories. But more to the point: We wonder where the mods were done- does Kenwood let stuff like this out? Or do some distributors repackage repaired stuff as new? Food for thought.

Darned if I can find the address, but I know of certain
companies which stockpile and sell out-of-production IC
parts, possibly all the way back to DTL. I recall ads in
some of the weekly electronics parts newspapers, so check
the nearest tech library. Of course, paying $13.00 per
flip-flop may seem a lot, but it's cheaper than replacing
the radio. Also try calling some local parts reps to see if
they have the names of the out-of-production parts houses.
The one I am thinking of is named something like Rochester
Semiconductors (??? fading memory cells).
Good luck and 73........de WD5IBS

254. RADAR and LIDAR

Newsgroup: rec.ham-radio
Date: 1989-03-28 17:30:41 UTC
From: AXVSCCN@UICVMC.BITNET
Message-ID: <8903281832.AA10907@ucbvax.Berkeley.EDU>
Source record: 19182

I really hadn't intended to send in another article about this
subject but since I was mentioned a couple of times in other
messages I thought I'd give a rebuttle. RADAR and LIDAR are
not perfect tools. A police officer *did* clock a tree moving
at 80-some odd MPH and this caused a major fuss about radar
and radar standards in the early 80's. What was overlooked by all
the gearheads was that the radar was clocking RFI --obviously not
emitted by the tree. Most trained law enforcement personnel are
aware that trees usually do not travel that fast except in hurricanes
and tornadoes. The test that clocked that tree was not conducted by
the police. Instead, it was conducted by an individual trying to
illustrate that electronic devices can be fooled into giving false
indications. I deliberately did not use the words "false reading"
since it is the police officer that makes the reading (based on the
indication of the display). The person reads the meter, the meter
indicates the speed. A trained and experienced police officer would,
in all probability, ignore such an indication, move to a better location
and go fishing again. There are enough legitimate speeders out there
that a police officer doesn't have to make an improper bust. New
proposed standards for radar RFI and low-voltage were drawn up but were
never passed into law because they would have required most police
departments to purchase brand new equipment. Keep in mind that most
radar equipment was purchased with federal monies after the 1974
Emergency Energy Conservation Act 55 MPH speed limit was imposed. One
radar manufacturer, Kustom, took the initiative to adopt these standards
on their own (yeah Kustom!). The biggest problem, as I stated in a
previous note is not with the equipment but rather with the operator.
I have been to a few illinois State Police radar training courses that
would make most people wimper in front of the judge. These courses
basically talked about the Doppler principle, how to plug the radar into
the cigarette lighter outlet, and how to take a reading. A spiffy
certificate was then issued. If I received a ticket from one of these
guys, I'd fight it to the limit. Most radar manufacturers provide on-site
training in their latest equipment and offer a train-the-trainer course
for larger departments. These course range from good to poor. Remember,
these couses are being given by the people who sold the equipment. If
the company is responsible, they will explain the limitations and problems
inherent with their equipment (as with all Doppler radar's). If not, they
will breeze over this stuff. My point is, don't always blame the equipment.
No flames please. Let's end this non-ham discussion on a happy note !

255. Re: Need schematic for C-IV to RS-232 interface

Newsgroup: rec.ham-radio
Date: 1989-03-28 18:01:40 UTC
From: jans@tekgvs.LABS.TEK.COM
Message-ID: <4847@tekgvs.LABS.TEK.COM>
Source record: 19367
Body handling: HTML body converted to readable text

I did the same thing, except I bussed all the RS-232 handshaking lines through diodes into a 10uF resevoir to the input of the 78L05 so that the converter is interface powered! It works fine on four machines I've tried -- be aware, however, the RS-232 levels can be as low as 3 volts, while the 78L05 needs at least 8. I considered using Maxim's snazzy micropower regulator that only requires ~0.5V overhead (MAX-666?), but the 78L05 seems to be working fine.

All the machines I've tried even supply enough "free power" to turn on a tiny LED. I added this since the Unix box I drive it from lowers all the interface lines under certain conditions, and my PC clone portable turns the port off completely to save power after so much inactivity, and I was having debugging fits trying to send data through a powered-off interface. (Self powering requires several hundred milliseconds after assertion of RS-232 handshake lines before the +5 is settled.)

Beware of using the "manufacturer's specifications" to build the circuit. (See following note.) I built it to spec and haven't had any problems, but my self-power scheme comes up real slow -- other power supplies can apparently destroy the device.

>Over the years, several Pro-2004 mods have been posted. One topic is
>speeding up the scan rate, but one mod involves changing the master
>clock frequency for the microprocessor while another involves inserting
>diode D514. Could somebody clarify whether one mod is better than the
>other, or whether either causes undesirable side-effects?

One observation I've made after using the diode method of "turbo scanning" the 2004 is that some weaker signals may not stop the scanner. I've run into this problem in speeding up the scan rate of other radios. However those signals usually are too weak to be worth listening to, so... In any event, I could slow down the scan rate from the front panel if need, though I've never had to.

Again, I would think my comments apply to any method of speeding up the scan rate. The problem I see is when the scan rate is increased to such a high rate that the frequency synthesizer can't lock on each frequency desired for a sufficient amount of time for an incoming signal to open the squelch and stop the scanner. (big inhale after that sentence).

Hi,
I will be travelling to Europe this summer. I already have the
reciprocol license paper work from the Arrl. What I would really
like to know is some back ground info. I'm not going to take
any HF gear (kinda big) so I was planing on "borrowing" some.

I will be traveling (at minumum) to Germany as home base (license here).
IF I travel to France, Austria, Switerzland etc, do I nned
a license for each country?

If I take a 2m HT, what do I need on mods, power (bring 30w pa?)

Is a 2m enough, should I bring 440 (oops 430)?

Am I better to bring my Kenwood 721 (It works for me very well !!).

These are just some of the things enquiring minds want to know.
Thanks for any help, It'll be my first trip with a radio (yes,
I've been there before).

According to the FCC, selling one's personal amateur radio equipment is
NOT considered *commercial* activity. Otherwise, swap-nets would not
be allowed on-the-air. My apologies in advance if this has already been
hashed over here.

>ways to "harrass" freedom loving citizens is sophomoric!

Funny you would mention that. Last Thursday I had one of these very sophomoric and apparently impossible encounters with a local county cop. I was driving home from the office in typical Atlanta rush-hour traffic - ie, bumper-to-bumper traffic across 5 lanes. Average speed perhaps 60. I'm at the back of the clump. I normally use an Icom headset in the car. I do not use the speaker in the headphone and instead opt for an external speaker mounted at about ear-level. I use the headset strictly as a microphone holder.

I notice in my mirror a car approaching at an extreme rate of speed. This car encounters the clump of traffic I'm in and tries several passing maneuvers including an attempt at the emergency lane. After several such attempts, he locks on the bumper of the car next to me with his high beams on. Then moves to my lane and literally buries his lights in my rear. As I slow to move over, he darts to the lane to the right of me to try yet another hero-pass. Blocked, he falls back onto my bumper and in a few seconds, a blue light appears on the dashboard - an unmarked local yokel. The twit had obviously gotten pissed at not being able to pass the clump of traffic and had picked out the car in the group with out-of-state plates - me, an easy target not likely to contest his stop.

I pull over and this little twerp comes up screaming at the top of his voice at me for not yielding to an officer. Having some law enforcement background, I asked him if he was on 10-33 traffic (emergency call) and he wasn't. He then tells me he is going to cite me for illegal headphone use and illegal use of a "scanner" (I use an HT in the car.) The GA law states simply that it is illegal to obstruct one's hearing and has been interpreted to mean covering both ears with a headphone. I pointed out that a) my radio was a perfectly legal ham radio and b) my headphone was inert and in any event not illegal. I further volunteered to call his chief on the cellular phone to have the legality of my arrangement verified for him. Since this was about 10:00 pm, that was not what he

wanted.

His next remark was "Well you're so smart, try this... I'm going to write you a ticket for speeding - I clocked you at 85 back there" Well, he wrote the ticket for 75 mph and stated on the citation that he had clocked me for 3 miles - a distance that would have him about 2 miles outside his juristdiction.

Well, fortunately I have a witness in another car who witnessed this idiot's driving and heard the conversation via an open microphone on the HT. The court date is set and I'll probably win. The sad fact is though, that after I take a day off from work and pay a lawyer, most likely this cop will suffer no consequences and at most might get a wrist-slap. And I know of 2 other cases in the last year of police harrasment of hams because of headsets.

So Jim, your blind defense of cops is at best a knee-jerk reaction. At worst, it is a manifestation of the old "them against us" mentality that pervades most forces. At least in the force I was involved with, the old saying that "the only difference between the bad guys and the good ones is that the good ones wear uniforms" is very true. WITHOUT EXCEPTION, every cop I got to know well enough to gain some confidence was rotten to the core. Wanna know about the one selling kiddy-porn out of his motor-cycle saddlebags? How bout the ones running a bootleg booze operation in our (unfortunately) dry county? Or the all too frequent bragging of shaking this or that person down just for the fun of it? Or stopping the car so the cop could get a better look at the good looking babe driving it? Or how bout the one that bragged that his policy was to shoot first and yell HALT later. This is the guy who has killed 3 unarmed suspects to date and has been cleared in all three. Of course, this coverup had nothing to do with the fact that his dad is the chief! Does any of this ring a bell, Jim.
>
So yes, most cops are rotten to the bone. It's almost inevitable considering the low pay and poor working conditions most of them work under. You attract a certain personality that is generally anti-social, and is in the service mainly for the power trip. These cops DO harass hams - along with the rest of the population. It IS a problem and one that is not likely to get better.

>Ever been to a hospital ER and see the mangled bodies brought in to be put
>back together and/or put on ice for next of kin to identify? That will
>straighten you out in a hurry -- flat on the floor in dead faint.
>
yeah I sure have but so what? I sure didn't faint. Not one of the most pleasant jobs I've had but not the worse either. But what does this have to do with police harassment of hams with headsets? Surely you're not trying to justify cop behavior by citing the rotten jobs they sometimes have to do are you? I hope not.

Jim, I kinda hate to ping on you but you hit a real sore spot with me. Probably starting with the 55mph debacle, cops have managed to breed a

contempt of the law in the ordinary citizen that is very disturbing.
I was raised to respect the law and call cops "officers" and never
call them cops. That respect was well earned. The fact that my
grandfather was a sheriff and my father was a county executive probably
had some influence on my attitudes. It was with great reluctance and
soul-searching that I finally admitted to myself the obvious -
Modern police for the most part are simply scuzbags. My reality-check was to
ask my father's opinion on a couple of occasions. He agrees.

Sorry for the long posting but I feel better now :-) Maybe we can
now get back to more important things like the upcomming No-Code license.

This is patently ridiculous, thinking that this is actually an alien spacecraft sighting. Most likely, this was either a bit of humor, or the 'alien' spacecraft is 'alien' only in the sense that it was not made in the US (most likely Soviet). First of all, if there really was an alien craft, and the crew wanted to say something to Houston about it and wanted to keep it secret, they would *not* broadcast over an open, unencrypted channel that every Tom, Dick, and Harry with a $99.95 scanner could pick up. More likely, if an alien ship did appear near the shuttle, the crew would turn around and head for home, under orders from the ground, since they're not equipped for alien contact. Finally, any *real* aliens would make contact with government officials, and we can assume that this didn't happen, since at last check, Bush was at some elementary school, talking about U.S. drug policy.

I had a similar experience a while back with a Kenwood TH21BT that I purchased from AES. A couple days after I received it, there was no output whatsoever. I sent it back to AES for a refund (which they gladly gave with no hassle) and asked them what the matter with it was... They said, "Bad speaker"... I had checked, and it wasn't a bad speaker.. I had not checked any farther into it though...

Seems strange that another problem of this nature should show up under almost the same conditions in a TH21xx model..

In Message-ID: <1241@naucse.UUCP> Robert Wier relates:
>
> I believe that wearing "both ears" headphone may be illegal
> now in Texas. When I was living there several years ago I
> know there was serious discussion about this since a number
> of fatal traffic accidents had been attributed to driver's not
> hearing warning signals (trains, etc). Easy to understand why

A bill to outlaw binaural headphones was just introduced into the Ohio General Assembly for this very reason. Public radio interviewed the legislator who introduced the bill, and he stated that he made the decision after performing hornblowing experiments with headphone wearing teens shaking their heads and snapping their fingers to the music. None heard his horn, and he decided that people that oblivious to their surroundings were a hazard to other motorists.

Personally, I don't think that banning the headphones alone will do it. I've heard teens drive by in cars with the windows closed and their radios so loud that the racket was uncomfortable to people walking on nearby sidewalks. So, if we're going to do something about people who go around cut off from their surroundings, we can't stop with stereo cans.

Maybe I'm getting old, but I think all drivers under 25 should be preceeded and followed by escort vehicles with flashing lights and red flags. [:-)

From: phil@uxd.cso.uiuc.edu
Message-ID: <30500003@uxd.cso.uiuc.edu>
Source record: 19187

> The nicads themselves are marked:
> 'Standard Charge 50ma for 16hrs'
> 'Rapid Charge 150ma for 5hrs'

If it is the same battery with both markings, you should be able to charge them with any current up to the rapid charge rate. However, with rapid charging you do need to be careful. Good rapid chargers will have a heat sensor. As the battery reaches full charge, it cannot store more energy so it dissapates what you give it in the form of heat.

> So... does the charge rate increase by 10, as I will be charging 10
> batteries? I think not. Also, I guess they will have to be in series?

In series, the voltage will increase by 10 to achieve the same charge rate. Series circuits divide the voltage among its elements. The current for the whole circuit represents the flow rate in each element.

I also urge using SLOW charging rates if at all possible. This prolongs the life of the battery and allows it to reach a maximum charge. The slow charge rating of the battery is probably the point that they can safely handle an overcharge, i.e. leaving the batteries in the charger for an excess of time. I usually overcharge my batteries but have not had much trouble with it.

If the batteries are slightly warm, then that is ok. Hot is a problem.

Use a DC source of some steady voltage a bit above the 12 volts the 10 batteries would produce. Choose a resistor value such that not more than 50ma will flow when the batteries are in the circuit (you will need to test the batteries for their internal resistance). Calculate the voltage drop across the resistor (or use the whole voltage of the source to be extra safe) times the current for the resistor wattage rating. Add a rectifier of appropriate current rating of the source is AC. A 250ma fuse would be a nice addition if the power source does not have one.

At the time, I made multiple phone calls to HRO HQ in California, and basically was told that they would look into it and call me back. Upon callback they told me it was the local store decision and would do nothing to assist.

I should add that Yaseau was absolutely no help in this at all. I talked several times to Chip Majali (I probably have the spelling wrong) who I understand is the VP for Yaseau America. He lied to me about several items, ie. claiming equipment was received by them a week after I claimed, and changed the story after getting copies of the UPS Delivery signatures (the claim at the time that the box sat on their loading dock for 10 days), that he would talk to the service manager about expediding my service (he never did, I talked to the service manager five days later to ask him the status and was told that he never heard of me, and Chip was magically on vacation) ...

Oh well, enough of this thread ... I'm sure some individuals have had good experiences, and some bad with HRO ... Unfortunately all of mine have been bad.

aliens would make contact with government officials, and we can
assume that this didn't happen, since at last check, Bush was at
some elementary school, talking about U.S. drug policy.
More guesses. How do you know that? I counter your skepticism with my
skepticism.

I think that a piece of hard evidence could be found if several people
can be found who heard the report of the "fire" and the "alien craft"
transmissions, AND they are missing from official NASA recordings.
If that's the case, then it lends substance to Stanford T. Friedman's
accusations of a government coverup.

277. Recent RS-10/11 Satellite Observations

Newsgroup: rec.ham-radio
Date: 1989-03-29 20:03:09 UTC
From: wwg@brambo.UUCP
Message-ID: <558@brambo.UUCP>
Source record: 19194
Cross-posted to: rec.ham-radio,sci.electronics,sci.astro

If anyone objects to these postings, let me know by email. My only purpose in distributing these observations is to hopefully stir up some interest in satellites-- especially those who, like me, only own HF gear at the present time. RS10/11 and OSCAR-9 are good satellites to tune in on using HF. There are probably others. RS-10/11 is workable from 15 meters-- giving the HFer a chance to "test drive" satellite communication, before jumping in with wallet, er I mean, both feet :-).

If there are errors, please feel free to email me. The interpretation of the telemetry is based upon old information-- ie: that of prelaunch information for RS-03 thru RS-08. There are "?" where new signals are used. Some of the decoded signals below, might not be correctly interpreted, if the formulas have changed for RS-10/11. For what its worth:

About the "Thoughts on the future of Ham Radio":

AMEN!!!! Touting our hobby to all who will listen is what's going to
save it. A No-code license by itself won't do it.

But.....

>One church that I know of is quietly installing amateur radio
>stations not only in their regional centers and headquarters,
>but in more than 25% of their chapels. Local church leaders
>are instructed to choose and assign several people from each
>congregation to take classes and become licensed amateurs.
>Wonderful!

Wonderful! ?? I'm not so sure. Sounds to me like they're trying to set up
a business communications network that is prohibited by Part 97. Remember,
just because you're non-profit, it doesn't follow that your communications
are non-business. Why are they doing it "quietly"?

I'm also not too keen on the idea that people are being "assigned" to
become hams. Becoming a ham is something you should do because you *want*
to explore all the opportunities ham radio has to offer. I wonder what
kind of hams these people who are forced into it will make.

I will admit, the evidence for my conclusion is as skimpy as the evidence for the UFO theory, but let's be realistic. Astronauts have been seeing 'UFO's' since the dawn of the space age, and the vast majority, if not all, have been sightings of expended booster segments, ejected garbage, and frozen urine. Each time, the UFO crowd came running, and each time there was a very reasonableexplanation for the phenomenon. Each time, the UFO crowd then claimed that there was a massive coverup. Well, it's been a quarter of a century now since these sightings from sapce have started, and I find it difficult to believe that an event of such magnitude as contact with alien life or alien technology could be kept secret. When alien life *does* contact us (and I am of the opinion that we are not alone in the universe, although I am not on the edge of my seat, waiting for them to come along), it will hit us like a ton of bricks. Two tons of bricks.

A very possible explanation of this occurrence comes to mind: since the frequency of the alleged transmission is in the middle of the commercial radio band, it is possible that someone with a radio set to that frequency broadcast the two items to see what happened, knowing that someone might be listening. A pretty good joke, if you ask me.

Source record: 19224

I am posting this because I am sure others have the same problem
as me.

RE: latest Hamfest Listings, East Coast Area.

For the benefit of those of us who are not geographical experts
a city/town and STATE in the place heading would be very helpful.
For some of these listings one would have to look up the contact
point in the call book or someplace.

If the listing is going to take up this much room, it might as well
be useful. I'm sure a few extra lines wouldn't hurt.

Thanks

73,
Michael WA7SKG

291. Just Say No to Radio Shack

Newsgroup: rec.ham-radio
Date: 1989-03-30 02:53:13 UTC
From: kd2bd@ka2qhd.UUCP
Message-ID: <828@ka2qhd.UUCP>
Source record: 19207

Dave, WB9VRM/AA, recently posted an article on the net suggesting a boycott of Radio Shack. Dave's article begins:

> Subject: radio shack BOYCOTT
> Path: ..!TRWIND.IND.TRW.COM!dsweiger (Dave Sweigert @ The Internet)

> Yes, I too have been RIPPED off by Radio Shack. All I needed
> was a 83.7 volt neon lamp for my science experiment due two days
> later. Well, the kid behind the counter did not even have a
> degree in engineering and completely misunderstood the premise of my project,
> measuring the oxygen content on Mars during Earth's rush hours.

Actually, there are several reasons why Dave didn't receive his Radio Shack ordered electronic component on time. First of all, neon lamps are very temperature sensitive, and since he specified an ignition voltage without an ambient operating temperature (in degrees C), the people at Radio Shack probably didn't know how to 'phone in the order to "headquarters".

Another reason is that Radio Shack doesn't advertise the part ordered. That's kinda like ordering a new car by going to Pathmark!

Anyway, Radio Shack DOES advertise specially ordered scanning receiver crystals. I believed their advertisements, and that's how I got shafted!

To refresh everyone's memory...

I ordered two VHF crystals from Radio Shack in the beginning of December 1988, and am STILL (it's almost April now...) waiting for one more to come in. (The crystal that finally came in a few weeks ago oscillates 20 KHz too low in frequency, but that's another story!)

The Radio Shack salesman promised a two to four week delivery date, but he didn't elaborate on what YEAR the order would come in. After waiting four months, the Radio Shack manager REFUSED to refund my order.

(Memory refresh complete.)

This incident was only one of MANY discouraging encounters I have had with Radio Shack stores in general. Most of those 15-pack 2N2222 transistors are company rejects, some have even EXPLODED on me!! Their 5-1/4 inch floppies physically scrape in their jackets when used (it's audible). I had a screw driver from one of their tool kits fall apart in my hand! The salesman said "You musta used it for a chisel!" Yeah, right! I found that their 12v, 3amp power transformer drops down to 9 volts under a load of only 1 amp! Some of their audio tapes cannot be recorded on, and the list just keeps on going!!!

After posting my orginal article, I have had the opportunity to exchange notes with a good number of people who have similar (and, in many cases, worse)

problems with Radio Shack. My freindly advice is to avoid Radio Shack if at all possible! True, there are many people who enjoy doing business with Radio Shack and find nothing wrong with them, but if you are used to QUALITY (huh?) then do yourself a big favor and

* Just Say NO to Radio Shack! *

Still not convinced???? READ ON!

One of my friends currently works at a Radio Shack store. Recently, a customer entered his store and inquired about a scanner that was on sale that month. After determining that his particular Radio Shack store didn't have that scanner in stock, being the gentleman that he is, he directed the customer to another nearby Radio Shack that did have the scanner in stock.

When his boss heard about his diverting a sale to another store, he blew up at him! His boss didn't want to hear anything about "just trying to help the customer", and came back at him several times screaming:

"FU(K THE CUSTOMER!!! FU(K 'EM!!!

Obviously, my friend felt like "two-cents" after the ordeal, but it just goes to show where the Radio Shack priorities are: $$$. He also gets heat from his boss when he diverts non-ham customers away from their 10-meter rig!

...And some of you guys on the net have the nerve to DEFEND Radio Shack??

SHAME!

I have another friend who USED to work at a Radio Shack store. "Never again", he says, "will I work for that rip-off outfit!"

73 & Peace

>
> How do you know that? I counter your skepticism with my
> skepticism.

I will admit, the evidence for my conclusion is as skimpy as the
evidence for the UFO theory, but let's be realistic.
So why do you advance further guesses below? Your skepticism seems to be
as hard a belief as the UFOnatics. Skepticism means looking at the facts,
and if the facts say "we don't know", then we don't know.
Astronauts have been seeing 'UFO's' since the dawn of the space
age, and the vast majority, if not all, have been sightings of
expended booster segments, ejected garbage, and frozen urine.
So? Most lottery tickets aren't winners either. That doesn't mean that
all lottery tickets are losers.
Each time, the UFO crowd came running, and each time there was a
very reasonable explanation for the phenomenon.
Not true. There is always a small percentage of unexplainable occurrences.
Whether you believe these are noise or genuine UFOs depends upon your beliefs.
Each time, the UFO crowd then claimed that there was a massive
coverup.
Unfortunately for you, the coverup explanation fits many facts just as well
as the no-UFOs explanation. For example, many of Philip Klass's objections
to the MJ-12 papers can be answered by "of course that would happen if it were
being covered up."
Well, it's been a quarter of a century now since these sightings
from space have started, and I find it difficult to believe that an
event of such magnitude as contact with alien life or alien
technology could be kept secret.
Unfortunately, you can't prove a negative, so we're back to beliefs again.
When alien life *does* contact us (and I am of the opinion that we
are not alone in the universe, although I am not on the edge of my

seat, waiting for them to come along), it will hit us like a ton of
bricks. Two tons of bricks.
More guesses.
A very possible explanation of this occurrence comes to mind: since the
frequency of the alleged transmission is in the middle of the commercial
radio band, it is possible that someone with a radio set to that frequency
broadcast the two items to see what happened, knowing that someone might be
listening. A pretty good joke, if you ask me.
More guesses. If you don't know, just say so.

If it's who I think it is, they believe that in the last days before the 2nd Coming of Christ, "true believers" will be driven underground by persecution, not unlike the early Christians hiding in the Roman catacombs. Hence, in their own eyes they are preparing for life threatening emergencies. Good recruits for ARES. Sign 'em up.

>videocipher and TV ? Or can they barge into your living room on suspicion ?
> ...etc.

When the FCC cracks down, it's not by driving direction-finding vans
around looking for telltale radiation. It's by scanning the ads in
TVRO magazines, "Nuts & Volts," classifieds in Radio-Electronics, and
getting tips from dealers about mod-shops. They're going after the
technicians and equipment vendors who "support piracy," not
individual dish owners. Increasingly, the public's right of access to
information depends on the right of access to equipment. Thus,
technical regulation of electronics (mostly under rules Part 15) is
getting intertwined with censorship and "values management." There
was a case last year (US v. Elery L. Beale Sr., US District Court in
Maine) in which a judge held that someone who sells a device that
"assists" in unauthorized reception - in that case, a cable TV decoding
box - can be guilty of violating Section 605 of the Communications Act
of 1934, EVEN WITHOUT PROOF THAT UNAUTHORIZED RECEPTION ACTUALLY
TOOK PLACE. Think about that. If a scanner can assist unauthorized
reception, selling it could be illegal even if no one uses it illegally!
One more incredible judgment about FCC powers by a judiciary system
that is massively ignorant about technology, and insensitive to the
"free flow of information" ideals on which this nation was founded.

Source record: 19135

My, My, the stuff that develops from a simple comment.

Didn't all this start from a posting that said something like:
"A Penn cop told me they had a new radar that couldn't be
picked up by radar detectors. What is it?" Actually not an exact
quote, but you get the idea.

What a timely remark. That questions has given us a wealth of information
on safety regulations, electronic warfare, judicial systems, regulatory issueson
emissions, warnings on speed traps and much much more than could be listed here.

But did anyone really answer the question? Has anyone contacted the PA
State Police to see what they are using? Cops aren't really bad people
as a rule. In fact some are downright nice. Stop and talk to one sometime
buy him a cup of coffee and ask him how his radar works, what brand,
model etc. Let's get the real story instead of a lot of gas.

BTW a public safety supplier (GALLS) advertises Ku band radar, model
K-55 moving radar by MPH, Inc and claims that it is undetectable by
all radar detectors. Great selling point even if it isn't necessarily true
after all, it's only a lie if you're caught, right? This is probabaly
what started this whole mess. If you want one of these radars, they're
about $1600 new, $400 reconditioned with a 90 day warranty.

73,
Michael

300. First AOR AR-2515 scanners are shipped

Newsgroup: rec.ham-radio
Date: 1989-03-30 14:08:33 UTC
From: parnass@ihuxz.ATT.COM
Message-ID: <4304@ihuxz.ATT.COM>
Source record: 19139

x
FIRST AOR AR-2515 SCANNERS ARE SHIPPED

by Bob Parnass, AJ9S

As David Woo recently discovered, AOR is still having quality problems:

o "Due to the inordinate number of returns of the AR900 from dissatisfied customers, we have dropped the product from our catalog..." - Judy Grove.

This is reminiscent of the troublesome Regency HX-2000, which was actually made by AOR, and was the first portable scanner to cover 800 MHz.

It was against this backdrop that scanner hobbyists cautiously awaited delivery of the first AR-2515 super scanner. Now the wait is over.

The first five AR-2515 scanners were shipped this week, and Chicagoan Ron Kosinski received his unit on March 29. He reports that his scanner, serial number 08127, arrived in a box labeled AR-2002. Although the "guts" are made offshore, the final assembly of 2515 modules is done in Indiana.

Ron said the ACE employees worked through the weekend to produce the first batch, already a few weeks late. He was told that the front panel escutcheon is produced in the USA, but the holes for the keys were too small, so workers had to enlarge them with X-Acto knives! Ron lamented that the result was a less than professional look, and ACE promised to send him a new escutcheon when they become available.

The keys themselves wobble too much, but it's not clear that a new escutcheon will cure the loose fit.

The procedure to program the 64 banks of 32 frequencies differs markedly from Uniden and Radio Shack scanners. The AR-2515 has no notion of a "channel." Rather, you can add or delete a frequency in a bank, and frequencies are stored in reverse order (high to low) within in each bank. You can lock out frequencies, but the the enabled frequencies will always be scanned in reverse order (e.g., 470.3125, 470.0, 460.4, 453.8, 443.1 MHz). Your

scan rate may vary -- AOR recommends that you NOT STORE FREQUENCIES WHICH DIFFER BY MORE THAN 25 MHz WITHIN THE SAME BANK, or the scanner will slow down! Banks can be "linked" together to permit scanning a succession of banks.

Ron reports that the bottom mounted speaker produces very respectable audio.

There is but a single BNC antenna jack for the entire 5 - 1500 MHz range. Mobile mounting strategy is left to the cleverness of the owner, as the 2515 is supplied without mobile bracket, and there are no holes in the case for same.

The manual consists of a few sheet in a plastic binder. At almost $700 list price, Ron isn't sure whether he will keep the AR-2515, but he's going to have fun trying it for the next 25 days.

>
What I mean by 'not equipped for alien contact' is just that. What do aliens
breathe? Are they radioactive? Do they have microbes that could cause disease
in humans? What do they eat? Before you let aliens in the shuttle with you,
you had better know these things, or at least be prepared to deal with them,
or you're asking for real trouble. You'd want a quarantine area, for starters,
most likely special atmospheric requirements for the aliens, and some idea of
how to speak with them. It's even possible that the psychological shock of
meeting alien life forms could be too much for some people; you'd want very
stable types on a meeting team. I'm not saying that the U.S. has any kind of
policy regarding aliens from space (we can barely deal with aliens from
Nicaragua :-)), but I would think that some minimal preparation is necessary.

In a word, NONSENSE! Communications Concepts sells various amplifier
kits and parts including the 2-30 MHz. amplifier described in Motorola
application note AN762. Their phone number is (513)-220-9677. They are
perfectly legitimate. I bought their AN762 kit, and found it performed
flawlessly, meeting all the specifications shown in the Ap. Note. Also,
I have done a lot of fooling around with this and other similar amplifiers, and
I don't remember ever burning out a transistor. Of course, I always use
the rugged Motorola industrial grade devices (e.g. MRF421) instead of
the cheap MRF454. Another source of amplifiers is RF parts Co. in
San Marcos, CA. They advertise a lot in the ham radio magazines, but
I have never dealt with them.

This is not a "good" rapid charger. As I understand it, heat is a deadly
enemy of nicad lifetime. A better method is to sense the voltage increase
flattening out *before* the batteries start heating up.

I was disgusted to find the icom rapid chargers used such a crude method.
You can feel the batteries are quite warm after a charge-up.

It seems quite possible that there was a "UFO" sighting. Literally.
Unidentified Flying Object, that is. Not necessarily a space
craft from an alien nation. Think about it--if you were up there,
and casually discussing it with Mission Control, you could very
well say that you're discussing the "alien spacecraft". Astronauts
have a sense of humor, too (at least a couple of 'em :-).

If this single transmission is all you've got to go on, I wouldn't
start packing your bags yet.

Hobbes: "What will we do when they come?"

Who said anything about letting them into the shuttle? It seems to me that if
you were to establish communications with the hypothetical aliens, then this
is "contact". Since we don't know what kind of communication the aliens
might use, I guess you could be "equipped for alien contact" if you had all
sorts of communication gear (radio frequency stuff, computers, lights you
can flash, etc)....it seems to me that the shuttle is already equipped with
some of these things (admittedly, most of it not designed for "general use").

>You'd want a quarantine area, for starters,
>most likely special atmospheric requirements for the aliens, and some idea of
>how to speak with them.

Since you would need to communicate with them aliens to determine things like
atosphere requirements, need for quaretine, how to "speak" to them, etc., I
think that most "preparations" would be a shot in the dark....how would you
know requriement unless there had been previous communications?

>It's even possible that the psychological shock of
>meeting alien life forms could be too much for some people; you'd want very

Astronauts would be pretty stable, don't you think? The government trusts them
with a multi-billion dollar space craft, and they are picked for their
scientific curiosity and sharp minds.

```
->Well, from orbit, the United States is clearly the most advanced nation on
->Earth. More roads, dams, and bridges are in the U.S. than anywhere else on
->Earth. Compared to the U.S., the Soviet Union is third-rate, at best.
-
-And don't forget that the US probably puts out more RF energy than any
-other nation on the earth, which is a sure sign of a scientifically
-advanced culture (even if most of it is soap operas and cartoons!).

Or we're the only ones still backward enough to require large-scale ground
transport, and unsophisticated enough to broadcast RF signals instead of
cold-fusion-powered, phase-modulating lasers for communication?

Anyone who can get here over multi-lightyear distances may have verrry
different expectations for what "advanced" cultures look like on a planet.

SINCE I've got the bandwidth now, remember that the Apollo crews had to
go into isolation on their return just in case they had encounters with
alien viruses, germs, or cooties. Inability to quarantine the Shuttle
crews is one way they aren't "equipped for alien contact". They also
aren't equipped to destroy any important/secret materials if such
becomes necessary. (Maybe the Aliens are plague-ridden Cubans intent
on hijacking the Shuttle, transferring all the neat hardware to Mir,
and crashing it into the Pentagon...)
```

317. nocode petition filed with FCC

Newsgroup: rec.ham-radio
Date: 1989-03-31 03:37:00 UTC
From: phil@uxd.cso.uiuc.edu
Message-ID: <30500007@uxd.cso.uiuc.edu>
Source record: 19140

According to Westlink, TAPR and K7UGA filed a petition with the FCC to establish a no-code license. This proposal creates the "Apprentice" class which requires the Novice written exam but no code exam. It also grants all Technician privileges and grandfathers Novices.

While I personally support a "no code" license, I believe that the proposal just filed will definitely result in a disaster in the Amateur Ranks because the code exam is not being replaced by anything and the written exam required to operate 2 meters and such is being reduced. That is clearly a reduction of standards unlike a proposal being formed by some members of this group which replaces the code exam with additional written exam.

My greatest concern now is that a workable nocode license will not have a chance because the certain opposition to the one proposed will be applied as well to any others proposed that might have greater merit.

This has been my personal opinion. Email flames so I can delete them before they bother anyone else. Opinions are always welcome. I can also give more detailed info to anyone requesting it by Email. My new Email address is now <phil@uxd.cso.uiuc.edu> or the usual <phil@vmd.cso.uiuc.edu>.

I disagree; from orbit, the most advanced nation on Earth is clearly
Brazil. More oxygen-producing machines there than anywhere else.
Not to mention the largest H2O transportation network in the world.

Actually, if I were an alien looking for fun, I would head straight for
the place with the largest and sunniest beach, or the most spectacular
ski resort (North Africa and Antarctica, respectively).

I can not believe the brew-ha-ha over Radio Shack. Look, it is pretty simple. RS is the McDonald's of electronics. They employ high school kids to man the counter for $ 3.50 an hour. There products range from resistors to computers. I think everyone would agree that RS components will never be used on the Space Shuttle, but most experimenters realize this and do not expect alot from the RS store. So what is the grip?

If you have a problem you can call the CEO of Tandy, John Roach in Fort Worth, Tx and complain directly to him (or use snail net - 18th Floor of Tandy Towers, 76102). RS has a 30 day money back return policy, so simply remind the manager that this is corporate policy and hold your hand out for the cash. If he does not want to do it get his store number (01-XXXX) and write Mr. Roach.

I mean, come on, we are amateurs. Hams are pretty smart. Use your brain. The system will work if you try it.

Sure, I know RS has some real losers, but I understand that when I go in. Funny, but they still have things I need; solder, antenna masts, batteries, presents for nephews, etc. I do not special order crystals from RS, there is a company in Florida called JAN for that. RS has a place in the community, if you get bad service from RS go to RS Corporate instead of informing the net of every $ 8 deal that went sour.

I have listened here occasionally. My equipment here is an R7000 and scanner beam antenna, not the greatest for this band but...

My question is why is it RS-10/11? I think my AMSAT reference card lists them separately. Are there 2 birds in the same orbit (they launch many together, maybe these are too close together)? Is it some kind of dual transponder/robot combo?

Just curious...

To: INFO-HAMS at WSMR-SIMTEL20.ARMY.MIL

Have you folks heard of this before?

From Federal Communications Tech News, 1:3:1, September 1988

"RADIO LANS

"FCC CERTIFIES SPREAD-SPRECTRUM RADIO LAN AT 900 MHZ

"On August 10, the FCC approved the first license-free radio LAN transceiver operating under part 15 rules in the industrial-scientific-medical (ISM) spectrum at 902-928 MHz. The product, known as ARLAN 100, is manufactured by Telesystems SLW Inc. of Ontario. The company claims a system aggregate data rate of 200 kbps. A patented, VLSI-based direct-sequence spread-spectrum scheme is used, with CDMA packet switching and CRC-16 error detection/ retransmission. The cost is approximately $1500 per node.

"The ARLAN 100 uses a 3-inch monopole antenna ['whip' - WB8VNV]. At 0.1W, the system is said to have a typical indoor range of 300 feet, and outdoor range of 3400 feet. In 1W high-power mode, Telesystems claims an indoor range of 1200 feet and outdoor range as much as six miles. The device backs-off power depending on error rate. 'Our market is primarily the office, although we've done tests in very tough factory environments,' Telesystems director of operations Harvey Ikeman said. 'We will also focus on campus and between-building links. The six-mile range was obtained with high-elevation units, but the system is mostly intended for in-building communication.

"A May 1985 FCC order in Ge. Docket 81-413 authorized spread-spectrum systems for nonlicensed general use in the 902-928, 2400-2483.5 and 5725-5850 MHz ISM bands on a noninterference basis to licensed services. Maximum permitted out-put is 1W. Direct-sequence, frequency hopping, time hopping and pulsed FM systems are permitted. A grant has been optained for a video device, according to FCC staff, but several other Part 15 spread-spectrum applications have not been granted because of inadequate spreading of the energy over the band.
been g
"The ARLAN 100 network includes a controller that interfaces with a host computer. The controller can remotely configure nodes located at each PC, and it can be connected to multiple radio ports to expand zone coverage. The system can accommodate more than 300 virtual circuits."

The other literature I got from Telesystems SLW notes that they offer an optional directional yagi, and an omnidirectional whip, beside the standard "3-inch monopole" antenna.

Source record: 19160

In reference to earlier comments about need for more hams, and
specifically hams that are interested in being hams, I as most agree.
Comming from the ranks of CB many years ago, I usually turn an eye up
to the way many hams stereotype the cber and look down upon them.
(Yes, I do say them as opposed to we at any rate!) Many of them are the
type that would like to become hams, certainly not be criticized by them!
And of course, many of those lawless little people would never even come
close...
Just remember, there are many of them who aren't causing people (hams) any
trouble and who are as nice and socially responsible as hams!
CB is really (meant to be) an important radio service to people who need
to communicate between cars on occasion i.e. giving your friends a radio
to put in cars in a convoy on a once or twice a year trip!
My only question is: Why did the FCC put it on 27MHz and not something
higher than 50MHz?

[this is NOT, I repeat, NOT a flame]

Phil,

I suspect your attitude toward cops would change if you became involved in a department as I have. It would be a good experience in any event. Join an auxillary or reserve (or whatever they call it in your area). Go through the training. Get to know the guys. Go drinking with them. Eventually you will be accepted into the group and get to see some of what I mentioned before.

There is a strange psychology involved here, one created no doubt in part by the system. they are subjected to the same bootcamp-type training as in the military. It builds an "e'sprit de corps" or in other words, a "them vs us" attitude. One is either a cop and therefore "in" or he is a civilian to be controlled and exploited like so many head of animals. I suppose this mentality is bred to compensate for the poor pay and shitty conditions some of them work under but in any event, it produces cops that expect priviledge and excess way over and above the average citizen.

Another influence is that during the normal cop's day, about the only non-skuzbags he encounters are other cops. And when the day is over, they leave work and socialize mostly among themselves and talk about cop things - not that much different, i guess, to programmers except that we don't carry guns or harrass people.

I have spent hours discussing this with some friends of mine in the department who are not totally over the edge. They are dismayed by the conditions and at the same time are at a loss as to a remedy.

No, you will not find 100% corruption in any given department but I'll bet a week's pay that it'll be much more than 25%. Even 25% would imply that one in 4 are unfit - a most disgusting thought.

So give working with a department a try. You will at a minimum find it interesting. And perhaps you could serve as somewhat of a department concience. In any event, you would be much better equipped to fight the system when it messes with you.

john

328. info wanted on Trio TS-520X and Kenwood TS-43X

Newsgroup: rec.ham-radio
Date: 1989-03-31 19:39:39 UTC
From: steve@eos.UUCP
Message-ID: <3059@eos.UUCP>
Source record: 19159

I've been looking for a good deal on a compact, ac/dc transceiver
for several months. What I had hoped to find was a Kenwood TS-520
(an old favorite of mine). I was recently contacted by a ham who
has a *Trio* TS-520X, which he tells me is the Japaneese market
version of the radio. (Trio is the name of the parent company in
Japan. Kenwood is the name for US marketing.)

I'd need some help confirming information on the radio, upgrade
parts availability, and Kenwood USA's attitude on servicing it. I
was told that the radio was sold as a stripped version of the TS-520S,
having no crystal callibrator, cw filter, dc power supply, and only
one final amplifier tube (65146) for 25 watts (output?). The owner
told me he bought the rig in Tokyo, and added upgrade kits for
the callibrator, cw filter, and 2 finals to make it a 180 watt input
rig. What's still missing are the dc power supply components.
There was a kit available from Trio in Japan to add these parts, but
it is probably not available here. This brings me to my questions.

1) Is the above info correct?
2) Are the components required to add the dc capability (at LEAST
power supply transistors and a heat sink) available from Kenwood
or any one else in the US, and how expensive are they?
3) Will Kenwood USA provide service on this rig in the event that
I have some problems with it down the road? (Yes, I know that as
a ham I should be able to fix it myself, but I don't always have
the time, and I'm short on test equipment.)

Any other info or suggestions would be appreciated. PLEASE respond
by E-MAIL, as I don't usually read this newsgroup (so many groups, so
little time!).

Finally, I'm curious as to what a Kenwood TS-43X is. I've not been
closely following the rig models for the last few years, so it could
simply have escaped my attention. I am familiar with the TS-441 (what
a NICE rig!) and the 43X seems very similar, although there are some
differences. I happened to spot one in a Cessna 206 outfitted for
long-range ferry -- the 43X was to be its aviation HF radio (it was
sitting right under a Magnavox sat-nav receiver, and both were on top
of a fuel tank that had replaced the right seat).

Any info would be appreciated. TNX for your help.

>and crashing it into the Pentagon...)

Come on, people, let's use our heads here.

Let's assume first contact, just for the fun of it.

Now, what do we know?

Well,

I. We don't want physical contact. If the aliens are insistent we
may risk it, but germs aren't an issue until then - the shuttle and
the alien vessel would get near each other and then they would talk.

II. Any secret material carried on the shuttle is likely to be secret
mainly because of its technological content. If the aliens get here
they don't need it and keeping it secret from them is not very
important.

There are a million and one things you would want on a first contact.
Off hand I would come up with the following:

Teams of ...
Psychologists
Ethnologists,
Scientists of every type,
Representatives from majore international trading companies,
Military technolgy specialists,
Military strategists and analysts,
Management consultants,
Linguists
Biologists

A heavily armed brigade of space marines,

A bunch of fighters equipped for a space battle

A large number of space to space nuclear missiles

Some high powered lasers, particle beams, and other exotic
technologies in orbit with all systems off waiting for an on signal to
start burning.

A complete vbiological laboratory equipped to work with extremely
dangerous and contagious agents. (I believe the correct designation is P-4).

A module of some type that can be filled with any atmosphere we
can think of so that we can host the aliens if they wish.

A complete manufacturing facility so that we can provide them with
comfortable furniture if we do host them.

All of this should take into account the fact that the aliens may be
anything from 20 pound midgets to hundred ton whales and all of it
(including the people) should be equipped for emergency destruction
(our personnel, for example, could have radio-detonated explosives in
a necklace around their necks).

Basically, there is so much that you would want that you could never
get it all into space.

So what do you need?

A vehicle - the shuttle.

Contact personnel - the astronauts.

Communications equipment to contact the aliens - on the shuttle.

Ground side experts - available at any time.

All of the above is always available, so the shuttle is always as
ready for alien contact as necessary.

Because when CB was instituted, "higher than 50 MHz" was high-tech!
We're talking about the late 50's/early 60's here. Tubes were king.
Radio gear was EXPENSIVE. VHF gear was both expensive and exotic.

CB was intended to be cheap-and-easy. It wouldn't have been either,
in the early days, had it been on VHF.

Greg

332. End of an Era - In time or too late?

Newsgroup: rec.ham-radio

An ARRL HQ employee who has been frequenting the Fidonet HAM conference has been hinting strongly that in a few days the ARRL is going to come out with the news they are going to support NO-CODE, which he claims is a widely popular view on the HQ staff.

My personal opinion is that this shift in policy, while admirable, is too little and too late. My personal view is that almost all of the VHF/UHF bands are scheduled to be auctioned off, but the news is being withheld until the last minute to avoid a political flap. I believe that ham radio AND CB will both be abolished and replaced by a minimal access requirement Personal Radio. (For ITU Treaty purposes, the FCC may continue to call it "amateur radio".)

What bands will this pseudo-ham service keep? Probably some of the existing HF bands, which aren't all that much in demand by commercial services anymore. On the higher bands? Possibly 902-928 Mhz so we can buy those Japanese trunked CB things and beefed up versions of the Part 15 gear that's being built for that band.

When you stop to think about it, it had to come to this. The entire history of ham radio has been a case of letting us tinker with frequencies which no one else wanted YET, but as soon as commercial or government services were ready to begin making use of them, we were out like a shot. It is self-deluding to believe it is going to be any different now.

ARRL BULLETIN 14 ARLB014
FROM ARRL HEADQUARTERS
NEWINGTON CT MARCH 27 1989
TO ALL RADIO AMATEURS

AN AMATEUR RADIO STATION IS SCHEDULED TO FLY ABOARD THE SPACE SHUTTLE IN MARCH 1990. APPROVAL FOR THE INCLUSION OF THE SPACE SHUTTLE AMATEUR RADIO EXPERIMENT CALLED SAREX ON THE SECONDARY PAYLOAD LIST OF FLIGHT STS 35 HAS BEEN RECEIVED FROM NATIONAL AERONAUTICS AND SPACE ADMINISTRATION HEADQUARTERS. RON PARISE, WA4SIR, A PAYLOAD SPECIALIST FOR THE ASTRO 1 PAYLOAD TO BE CARRIED ON THAT FLIGHT WILL OPERATE THE STATION IN THE ORBITING SHUTTLE. REPRESENTATIVES OF ARRL AND SAREX, COSPONSORS, THE RADIO AMATEUR SATELLITE CORPORATION, AMSAT, STATED THAT THEY LEARNED OF THE APPROVAL AT A MEETING WITH NASA OFFICIALS HELD ON MARCH 14 AT THE LYNDON B JOHNSON SPACE CENTER IN HOUSTON.

WA4SIR WILL COMMUNICATE WITH AMATEUR OPERATORS WORLDWIDE USING VOICE AND VIDEO COMMUNICATIONS AS WELL AS PACKET RADIO. THE ORBIT OF THE SHUTTLE WILL ALLOW AMATEURS LOCATED BETWEEN APPROXIMATELY 46 DEGREES NORTH AND 46 DEGREES SOUTH LATITUDES TO COMMUNICATE DIRECTLY WITH THE SHUTTLE. THE SAREX TRANSMISSIONS FROM THE SPACE SHUTTLE WILL BE SUCH THAT A STANDARD SCANNER RADIO CAN RECEIVE THEM.

THE APPROVAL FOR SAREX OPERATION IS CONTINGENT ON FINAL APPROVAL BY JOHNSON SPACE CENTER OF THE SAREX HARDWARE AND OPERATIONS PLAN AND ON PRIORITIZATION OF SECONDARY PAYLOADS FOR THE STS 35 FLIGHT.

>to the way many hams stereotype the cber and look down upon them.

I agree, I think we hams missed the boat royally by not looking at CB as a "happy hunting ground" for new hams. I have often heard CBers lament that they are bored silly with CB but can't find out how to get into ham radio. (By the time I heard they were usually either hams or in a class!)

>My only question is: Why did the FCC put it on 27MHz and not something
>higher than 50MHz?

Judging by the gnashing of teeth I have heard from FCC officials I think THEY wonder about that too! Asone said at a hamfest some years ago "If you looked hard for the very worst frequency for a restricted, low power, local service 27 mhz would be hard to beat in just about every respect!"

Ah well - "the sins of the fathers shall be visited upon the sons even unto the third and fourth generation". "Breaker, breaker this is the starship Enterprise ..."

Not so - the "Benton Harbour Lunch Box" (Heathkit 2M and 6M AM transcievers) was about the same perfomance as 11M gear of the day and very close in price ($80-$100). Most any of the miniature tubes of the early 60s would work quite well up to 200Mhz or so. UHF was a different story, but still not extremely expensive. The Class A (400Mhz) CBs of the day were in the $300-$400 range, but had performance similar to commercial FM gear.

I'd like the veto a food place. The food at the Hara Arena is lousy and is to be avoided.

How about a meeting place where we can all sync our synthesizers and get together after the days events? I have a friend in Dayton who I can ask for a recommendation. Anyone like Mexican food?

> --phil ka9wgn--

One problem I have had occasionally with Nicads is their shorting out at the
end of their lifetime. In the product using the cells this is no hazard as
the product just dies. If the cell shorts when plugged into a battery charger
then rather nasty things can happen to the current limiting resistor.
The two alternatives I know of to prevent this is to have "over-current"
triggering circuitry to shut the charger off or use a true current limiting
device. The simplest current limiting device I know of is a light bulb (its
negative thermal coefficient of resistance).

Several years ago I discovered that some brands of 6 Volt blubs would
(when cold) produce about the right resistance to allow me to tie together
AC and DC supplies of my Sanyo portable cassette player together. When the
external AC adapter was plugged into the player, the player would switch
from the DC to AC supply. With my modification a light blub still kept the
DC supply connected allowing a trickle charge to flow into the four nicads
in the unit. I experimented with differenct light bulbs to give me the
recommended low charging rate when the AC adapter was plugged in and the
player was not using any power. The bulb was tiny and fit into some unused
space in the player. The point is that battery shorting (and it has since
I made the modifications [gotta stop using Radio Shack Batteries]) is
harmless since in a worst case (all four batteries short at once!) it only
puts about the normal working voltage across the light bulb.

Though the above example is a low-wattage one, I have used the same technique
in a few other places.

Your milage may vary.

Let me ask you if the TECHNICIAN written exam is too hard for letting someone
on 2 meters? I think not. But I think the NOVICE written exam is TOO EASY,
code or nocode.

> Let's not lose sight of that fact that 2 of the 5 97.1 goals are basically
> to train and encourage growth in the technical fields.

Some of the learning needs to be done before getting the ham license.
But just how much is what we are discussing. CB'er could learn, too,
if they wanted to, but CB itself surely does not encourage it.

> Another commom myth is that today's tests are far easier than they were at
> <pick any date in the past>. This is a myth easily explained by the simple

Considering the overall availability of the question pool, and the multiple
guess format, I'd say they are, compared to a date before that happened.
Some have proposed a computer program generate written exams from a
programmed exam structure, where the particulars of the question be
chosen at random from reasonable values, and even the question formats
can be varied.

> observation that those of us have been around a while are a lot smarter
> than we were say, 10 years ago. We (hopefully) learn a great deal

Some of you are. Some are not. Back to 75 meters.

There was, and is, a CB service on 450 Mhz. At the time, UHF was quite
expensive and I guess the greatest importance was keeping the cost down.

Now days, 800 Mhz would be just great for CB, but that is filling up real
fast. Perhaps 2460 Mhz :-)

x
Some Radio Shack stores have already received shipments
of the new PRO-2005 scanner, the 400 channel, gray plas-
tic replacement for the now famous PRO-2004. With the
nearly vertical front panel, the 2005 is shaped more like
a piece of real radio equipment. Looks like the 2005
retains all the 2004 functionality, including Sound
Squelch and Tape output jack, but with raised rubber keys
instead of a flat membrane keyboard.

In addition to a BNC connector, the 2005 comes with a
telescoping antenna which fits through a hole in the top
of the cabinet, like the bygone Bearcat 220/250/300.

SpaceNews

MONDAY APRIL 3, 1989

SpaceNews originates at KD2BD in Wall Township, NJ, and is available on packet radio bulletin board stations across the North America and around the world on the MTTBS telephone BBS at (201) 494-3649, the Unix USENET News Network, and also on WangNet.

* HAM RADIO ON COLUMBIA! *

An Amateur Radio station is scheduled to fly aboard the Space Shuttle COLUMBIA in March 1990. Approval for the inclusion of the Space Shuttle Amateur Radio EXperiment (SAREX) on the secondary payload list of flight STS-35 has been received from NASA Administration Headquarters. Ron Parise, WA4SIR, an astronomer and a payload specialist for the ultraviolet ASTRO-1 payload, will operate an Amateur Radio station from the earth orbiting Space Shuttle. Representatives of the ARRL and SAREX cosponsors and AMSAT-NA, stated that they learned of the approval at a meeting with NASA officials held on March 14th, at the Lyndon B. Johnson Space Center, in Houston, Texas.

Ron, WA4SIR, will communicate with Amateur operators worldwide using voice and video communications, as well as packet radio. The orbit of COLUMBIA is expected to have an inclination of 28.5 degrees and a mean altitude of 190nm. This will allow Amateurs located between approximately 46 degrees North and 46 degrees South latitudes to communicate directly with the Space Shuttle. The STS-35 mission duration is expected to be nine days.

* OSCAR-9 NEWS *

All four HF beacons on OSCAR-9 have been switched on and are transmitting telemetry in 12 wpm morse code. The frequencies are 7.002, 14.002, 21.002 and 29.510 MHz. Interesting propagation effects can be noted when monitoring more than one beacon simultaneously.

A CCD video image was taken by OSCAR-9 on 28Mar89 at 09:23:58 UTC and transmitted all day on the 29th.

OSCAR-9's orbit continues to decay. The giant solar flare of 09Mar89 increased UO-9's drag dramatically, causing it to lose altitude at a rate of almost 1000 km per day! Orbital decay is now back to a slower 400 meters per day, and UO-9's altitude is now approximately 410 km at perigee.

The following is a recent Keplerian element set for OSCAR-9 as issued by the Royal Greenwich Observatory on 28Mar89:

```
Epoch : 89 087.62758864
Incl : 97.5654
RAAN : 136.6665
Eccn : 3.098E-04
ArgPer : 67.4405
MeanAn : 292.7136
MeanMo : 15.49386221
Decay : 6.1702E-04
RevNum : 41647
```

* OSCAR-11 NEWS *

OSCAR-11's Digitalker appears to be switched off, since normal Digitalker message periods are now silent. The Digitalker has been off for about a month. You can hear OSCAR-11 when it is in range on a VHF-FM receiver tuned to 145.825 MHz.

* OSCAR-12 NEWS *

The following is the latest operating schedule for FO-12 as issued by JARL spacecraft controllers:

Mode	Beginning (UTC)
JA	05Apr @ 1412
D	05Apr @ 2225
JA	08Apr @ 2145
D	09Apr @ 1238
JA	11Apr @ 1251
D	11Apr @ 2105

* OSCAR-13 NEWS *

The following operating schedule for AO-13 is expected to remain in effect until 03May89:

Mode	Beginning (MA)
B	100...160
JL	160...200
B	200...255
OFF	000...100

* SHUTTLE NEWS *

The U.S. Space Shuttle ATLANTIS is being prepared for an April 28th launch on mission STS-30, when it will take a crew of five astronauts in space for a duration of four days. The primary payload for this mission will be the Magellan Venus probe. The orbit of ATLANTIS is expected to have an inclination of 28.9 degrees and a mean altitude of 160 nm.

A Countdown Demonstration Test with the crew is scheduled this week at KSC on April 6th and 7th.

346. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1989-04-01 22:57:27 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <8904020315.AA13802@ucbvax.Berkeley.EDU>
Source record: 19173

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

347. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1989-04-01 22:57:54 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <8904020120.AA09114@ucbvax.Berkeley.EDU>
Source record: 19171

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

```
Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods = 0; minus sign = 1)
```

```
Line 3
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
```

09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

Note that the International Designator fields are usually blank, as issued in
the NASA Prediction Bulletins.

John......

Yes...EACH assembly must be mounted in its own seperate enclosures
and shielded.

ALL of the lines comming out from each assembly must go thru feedthru
caps (.001 uf)

To run full Duplex on 450 Mhz at 5 Mhz seperation (The standard split
on 450) you will need 40db isolation minimum at the antenna. You can
accomplish this with a vertical seperation of 30 feet between your
unity gain antenas (Ground plane types) or use a Duplexer on something
like a StationMaster or if it is Point to Point type communications
as you are going to do, 30 feet vertical seperation between your Yagi
antennas will do the same thing.

If you want to talk to me about this, give me a call at 800-243-3952
ext 434 weekdays between 8 am and 4:30 pm EST or 203-238-4994 after
6 pm (Home)

Later and 73

Hi,

I went out in my car early this afternoon. I saw a light change to yellow but didn't have time to react to it. It was red when I went through the intersection.

I saw one car from the other direction take a right so that it was following me. He turned left then I saw the police car behind him. I kept going 30 mph, the speed limit, but slowly the cruiser narrowed the distance between us until he got close enough to want to use his lights. Yup.

When he got to my window, I explained to him that I saw the lights change, but didn't react to the yellow in time (that's different from not having enough time to react, which I did). He asked for my license and registration (note that I have my callsign on my license plate). Handing them back to me, he warned me to be more careful next time (thus, no ticket). Finally, he patted me on the shoulder and said, "K1CDD" and walked away.

This was a first.

73,
jim, AD1/C
^
+----Mass. registry computers don't have a lightning-bolt character on their computer, but my license plate does.

350. Re: THE Dayton Ham-Fest

Don't forget that the packeteers' dinner is on Saturday evening (at
McNasty's again?), so the packeteers on the net might prefer that the
net get-together be on Friday if it's going to be after hours.

Not sure I'll make it to McNasty's this year, but if any of you are
wondering whether to go, do. It's in an old farmhouse (on an old farm,
in fact), and in addition to hearty chicken-and-corn-on-the-cob food,
there's basketball, horseshoes, softball, etc.

351. Why CB is at 27 MHz and not in a higher band

Newsgroup: rec.ham-radio
Date: 1989-04-02 07:10:38 UTC
From: rh@well.UUCP
Message-ID: <11200@well.UUCP>
Source record: 19175

In article <8903311906.AA18589@ucbvax.Berkeley.EDU> BIW104@URIACC.BITNET (Chris Tate) writes:

...
>My only question is: Why did the FCC put it on 27MHz and not something
>higher than 50MHz?
> Chris Tate - KA1IVW
> URI Amateur Radio Club
> BIW104@URIACC

The original Citizens Radio Service, established after WW2, was given about 10 MHz in the 460 MHz region. But because licensing was so open, and the equipment was initially expensive, the band was quickly dominated by business users, who petitioned the FCC to stop licensing the general public. All but the thin sliver now called the General Mobile Radio Service was taken away from CRS, and reallocated to business and public safety comms. A few years later, the Commission wanted to preserve the concept of a Citizens Radio Service, so dumped it in a sparsely-used ham band: 27 MHz. The hams fought it, as did the engineers who worked to establish CRS in the 1st place, but the FCC prevailed. There are lessons in this...

RTTY DX NOTES FOR WEEK ENDING 31ST MARCH 1989.
BID: RTDX3103

BAND CONDITIONS FOR THE PAST WEEK HAVE BEEN FAIR, THOUGH THERE ARE
INDICATIONS OF FURTHER SUNSPOT ACTIVITY IN THE NEAR FUTURE. WE HOPE THAT
THE BANDS WILL IMPROVE SOON AND THAT SOME GOOD DX WILL APPEAR, ESPECIALLY
SOME OF THE RARE AFRICANS.

OUR THANKS GO TO TG9VT, W1DA, I5FLN, OD5NG, 5B4PW AND VK2EG. AS ALWAYS,
THANKS CHAPS FOR YOUR NEWS.

BANDPASS:

FRIDAY:
HC8VB 14087 KHZ AT 0300Z
HH2BZ 14082 KHZ AT 0600Z
TY9JC 21089 KHZ AT 0925Z

THURSDAY:
NO REPORTED DX.

QSL INFORMATION:

TY9JC WILL QSL TO ALL CARDS RECEIVED AT HIS HOME ADDRESS OF DJ6JC.

HV3SJ QSL'S VIA I0DUD.

HI8EL QSL'S VIA BOX 973, SANTO DOMINGO, REPUBLIC DOMINICANA.

FR5ZD QSL ADDRESS IS 6 RUE M.DE NARBONNE, 97427- STANG SALE LES BAINS, REUNION ISLAND.

NOTES OF INTEREST:

ZL1AMO, RON, HAS CANCELLED HIS TRIP TO NORTH COOKS UNTIL THE END OF MAY OR EARLY JUNE. BUT IN THE MEAN TIME HE WILL BE GOING TO WALLIS ISLAND FROM THE 6TH TO 26TH OF APRIL AND WILL SIGN FW0BX. QSL TO HIS HOME ADDRESS.

TY9JC WILL GO QRT FROM BENIN ON APRIL 2ND.

LA2FFA WILL BE ACTIVE FROM ABOUT 84 DEGREES NORTH FOR ABOUT SIX WEEKS USING THE CALLSIGN OF JX0A FROM MARCH 22ND, USING PACKET AND OTHER MODES. NO MENTION OF RTTY.

IT IS REPORTED THAT JIM SMITH WILL BE ACTIVE FROM OCEAN ISLAND, EITHER THE END OF APRIL OR EARLY MAY, USING THE CALL OF T33JS. IT IS HOPED THAT HE WILL THEN TRAVEL TO TUVALU (T2) IF REQUESTED.

5W1GP WILL BE QRV FROM ROTUMA FROM APRIL 6TH. HIS LENGTH OF STAY IS NOT KNOWN, BUT HE WILL BE OPERATING BATTERY EQUIPMENT.

XF4L REVILLA GIGEDO WILL OPERATE FROM THE 11TH TO THE 19TH. THEY HOPE FOR RTTY OPERATION AS WELL AS OTHER MODES. QSL TO OH2BN.

MARION ISLAND, ZS8 WILL BE ACTIVATED DURING APRIL. EQUIPMENT HAS BEEN DONATED BY W6PQS AND THE SOUTHERN CALIFORNIA RTTY GROUP.

5B4PW REPORTS THAT THERE ARE NOW A NUMBER OF AMTOR STATIONS OPERATING FROM CYPRUS. 5B4SF,5B4MD, AND OTHERS SUCH AS 5B4AA AND 5B4OG, WILL SOON BE ACTIVE.

GL DE DX1 (VK2SG).

Written by Syd Molen, VK2SG. Forwarded via AMTOR by TG9VT and W9CD. Distributed via packet in North America by Tad, KT7H @ KE7OM.

The ARRL Letter, Volume 8, No. 5, March 13, 1989

Published by: The American Radio Relay League, Inc. 225 Main St.
Newington, CT 06111

Editor: Jay Mabey, NU0X

Material from The ARRL Letter may be reproduced in whole or in part, in any form, including photoreproduction and electronic databanks, provided that credit is given to The ARRL Letter and to the American Radio Relay League, Inc.

ARRL FILES REPLY COMMENTS IN PROPOSED RULES REWRITE

The ARRL has filed its Reply Comments in FCC Docket 88-139, the FCC proposal to reorganize the Amateur Radio Service rules. Previously, the ARRL had filed its own rewrite, called "Part 96," in response to the FCC's original proposal.

The ARRL used its Reply Comments to again take aim at the FCC's proposed Section 97.221, entitled "Restricted Operation." This one sentence Section, "The FCC may restrict operations as necessary to prevent harmful interference" would eliminate the procedural protection for amateurs contained in the present Section 97.131, which requires an investigation by the Commission.

Our Reply Comments state: "...the Amateur Radio Service will under no circumstances tolerate the proposed elimination of the procedural protection for amateurs contained in the present Section 97.131 of the rules. The comments validate that prediction. It is the League's intention to utilize all resources available to protect the Amateur Service from inappropriate Commission restrictions in RFI matters."

The ARRL's comments noted that the Field Operations Bureau of the FCC has commenced a program imposing arbitrary operating restrictions on amateurs who interfere with home electronic equipment. The program imposes the burden of the interference resolution on the amateur station, despite findings of no technical fault in some cases.

The ARRL's comments strongly attacked the program: "The Amateur Radio Service is unwilling to accept the burden of the continuation of these policies, much less the codification of Commission authority to impose them

without any procedural protection at all. Such policies create an irrebuttable presumption of fault on the part of the amateur, and deprive the amateur of an unconditional operating privilege available to all other Amateur Radio licensees of the same license class without the hearings mandated by ....the Communications Act..."

The most extensive comments filed, other than those of the League, were filed jointly by a number of broadcasting groups, including the National Association of Broadcasters, CBS, ABC, NBC, National Public Radio and Turner Broadcasting System. The broadcasters argued that present Commission policy concerning the use of Amateur Radio for news-gathering purposes was overly restrictive. Instead, the group suggests different wording which would broaden the categories of events in which amateur stations could be used in news-gathering situations. For example, the group suggests that amateur stations should convey news information for broadcast use where the information is "directly related to an important news event" and where other voice communications systems are unavailable.

The ARRL replied that this definition is too broad and includes events which have no relation to emergency, or even public-service, communications. For example, a football game can be considered an important news event. The ARRL noted that in the past amateurs have been exploited during certain emergency situations to transmit such non-emergency communications as personnel manifests and broadcast- equipment requisitions. The ARRL concluded that the rule changes proposed by the broadcast group are far too broad to prevent commercial exploitation of the Amateur Radio Service.

The ARRL filed its Reply Comments on January 31.

In a related story the FCC has denied a request for an extension of time in this docket, filed by David Popkin, W2CC. Popkin had asked that the time for filing comments be extended until July 17, 1989, reasoning since the League's comments were almost as extensive as the Commission's proposal, a similar amount of time should be allowed for study and reply. The Commission noted that Popkin's petition was procedurally defective, having been filed two days after the deadline for requests for extension of time. The Commission also said that 10 months had already passed since the proposal was issued and "in the interest of administrative efficiency, it is desirable that the proceeding be moved forward."

ARRL FILES REPLY COMMENTS ON SIX-METER SUBBAND EXPANSION

The ARRL has filed Reply Comments on the FCC proposal to expand the six-meter repeater subband, Docket 88-527. This NPRM would expand repeater operation to encompass 51-54 MHz. The League agreed with the Commission that "it is apparently desirable to expand the repeater subband, at least in certain areas of the country." Our comments discussed the comments filed by the Six Meter International Radio Klub (SMIRK) which were concerned about the possible impact of the expansion of the repeater subband on the "Pacific DX Window" (51.0 - 51.1 MHz). This portion of the 51 MHz band is used for weak-signal, long distance communications primarily with Australia

and New Zealand and other areas in ITU Region III. SMIRK is concerned about interference to the window which could result from repeater operation on the same or nearby frequencies.

The League said that it "is cognizant of the need to protect these operations, and absolutely will insure, through vigorous efforts to properly develop and administer a revised band plan for this band, that weak-signal operation is protected as long as operation in the Pacific DX Window is necessary."

The League's comments concluded by again emphasizing that expansion of the repeater subband on six meters to include 51-52 MHz was desirable "and can be accommodated on a planned, coordinated basis within the Amateur Service" without relying on FCC regulatory restrictions.

TRAVELING THIS SUMMER?

If you are planning a trip to a foreign country other than Canada and are interested in the possibility of operating there, you must apply for a license even if the US has a reciprocal Operating Agreement with that country.

You can obtain information about operating from virtually any country by writing the Regulatory Information Department at HQ. Please include an SASE. Remember that many countries require a minimum of 4-6 weeks lead time for processing of reciprocal permit requests, although some do offer walk-in processing.

Traveling to Canada? US amateurs traveling to VE-land are reminded that the US has automatic reciprocity with Canada. All that is needed for operation north of the border is your original license. Visitors must use the appropriate VE/VO/VY identifier, such as N4YE/VE2 when visiting Quebec.

GEORGE S. TURNER, K4AP, SK

George S. Turner, K4AP, former Chief of the FCC Engineering and Monitoring Bureau, died February 7 at his home in Boca Raton, Florida. He was 89 years of age. Turner joined the FCC in the 1930's and remained there until his retirement in 1964.

WILLIAM W. EITEL, W6UF, SK

Silicon Valley lost a pioneer with the passing of William Eitel, W6UF on February 26. He was a past President of the ARRL Foundation and Vice Director of ARRL Pacific Division in 1976-77.

In 1934, Eitel joined with another enthusiastic radio amateur, Jack A. McCullough, W6CHE, to form Eitel-McCullough, Inc. Their dream was to build more powerful vacuum tubes that would operate at higher frequencies than anything then available.

The tubes, originally designed for Amateur Radio usage, were quickly adopted for military and commercial transmitters as well, and led to important advances in radio communications.

"Eimac" as the new company became known, went on to become one of America's leading producers of electron tubes and related devices.

Eimac continued producing technical data and equipment for radio amateurs worldwide, including Project OSCAR. In 1965 Eimac merged into Varian Associates, which remains in existence to this day.

Bill had a fully-equipped laboratory at his Nevada retirement home where he continued work on ideas of interest to him. The amateur community shall miss W6UF.

EDUCATIONAL ADVISORS PROGRAM

Do you have experience in writing school curricula, critiquing educational publications or similar activities? At the January 1989 ARRL Board of Directors meeting, Minute 127 authorized staff to implement an Educational Advisor program. Interested? Send information on your area of abilities and expertise to Rosalie White, WA1STO, Educational Activities Branch at HQ

SIDDALL NAMED ASSISTANT CHIEF, LAW, MASS MEDIA BUREAU, FCC

David R. Siddall, K3ZJ, former President of the Potomac Valley Radio Club and Capitol Hill ARS, W3USS, has been named acting Assistant Chief, Law, Mass Media Bureau, FCC. He is responsible for legal review of Mass Media Bureau items. Siddall has been Senior Attorney in the Policy and Rules Division, Mass Media Bureau. Prior to joining the FCC Siddall worked as a Legislative Attorney with the Congressional Research Service of the Library of Congress.

PACKET RADIO ON 18 MHZ

On January 31, the FCC opened the 18 MHz band to Amateur Radio operation. Packet radio and other data communications (F1B type emissions) are permitted in the 18.068 - 18.110 MHz subband (regional band plans call for 18.100 - 18.110 MHz, with CW at 18.068 - 18.100 MHz) and, although the normal power limit of 1500 watts output applies, amateurs must not cause harmful interference to US government and foreign fixed service operations. On July 1, the band will be allocated exclusively to Amateur Radio use. (TNX: Gateway)

AMSAT UPDATES

In recent months there has been growing awareness among OSCAR satellite users that the 10 meter downlink spectrum of 29.300 - 29.510 MHz is being disrupted by 10 meter FM stations. All radio amateurs are reminded that this spectrum has been set aside by international agreement for use as a downlink passband for Mode A satellites (e.g. RS 10/11).

By operating within this spectrum, 10 meter FM stations "wipe out" a considerable portion of the downlink spectrum and render it useless for RS 10/11 satellite users. All amateurs not involved in using OSCAR satellites are reminded to honor this "gentleman's agreement" and avoid using 29.300 - 29.510 MHz.

AMATEUR AUTOPATCH UPDATE

More good news -- US West (Mountain Bell) has approved residential phone rates for Amateur Radio autopatches regardless of whether they are in a commercial or business location.

The basis for Mountain Bell's decision was the fact that regardless of whether the line terminated in a commercial location or not, radio amateurs are prohibited by law from using the service for business purposes.

For further information, contact the Regulatory Information Dept. at HQ.

AMSAT GROUND COMMAND STATIONS NEEDED

AMSAT-NA is currently forming a layered satellite "ground command station" organization to ensure the continuing availability of interested and trained spacecraft ground control operators. Immediate needs include the identification of command stations for the first Microsat series. Amateurs worldwide are needed for this endeavor. Long term needs include PHASE-II, PHASE-III, and PHASE-IV missions. Ralph Wallio, W0RPK, has been appointed Command Station Development Manager. Information and application packets are available by sending a business-size SASE to Ralph Wallio, W0RPK, 1250 Highway G24, Indianola, IA 50125.

NEW CONTEST ASSISTANT MANAGER AT HQ

Newly arrived from the snow and cold of the Midwest, Phil Rice, WB9JKI, has joined the ARRL Contest Branch as Assistant Manager.

Phil's duties here at HQ will include assisting the Contest Manager in administering League contests, scoring logs, QST results preparation, Special Events and Contest Corral.

Phil's interest falls into the area of contesting -- he has held call signs in the UK, Belgium, Switzerland, and Belize. He is a past member of the Society of Midwest Contesters and looks forward to contesting from his new home in New England. Welcome aboard, Phil!

FIRST 17-METER "WAS" AWARD ISSUED

The first 17 meter Worked all states Award was issued to Christopher M. Merchant, KA1LMR, on March 1. Chris was the first to submit his cards to the Awards Branch at HQ, according to Awards Manager Eileen Sapko. Congratulations Chris!

CANADA'S PROPOSED DEREGULATION ADDRESSED

The Canadian Department of Communications (DOC) has published a notice in the Canada Gazette (February 18) outlining proposals for deregulation of the Amateur Service in Canada.

The proposals would

(1) eliminate restrictions on the type of emissions Canadian amateurs may use within the amateur bands and instead, simply specify maximum permissible bandwitdh in each band without specifying subbands by mode;

(2) permit foreign amateurs visiting Canada to operate with the same frequencies and emissions as Canadian amateurs (at present, "lowest common denominator" restrictions apply);

(3) eliminate endorsements to the Amateur Radio Operator's Certificate, the legal authority for which apparently is questionable, and incorporate the privileges now granted by endorsement within the basic Amateur Certificate (one popular endorsement, available to a licensee after six months, permits ten- meter phone operation); and

(4) accomplish some other, relatively minor, updating and revision.

The Canadian Radio Relay League (CRRL) recognizes the problems likely to be created by deregulation of subbands in Canada, and at its August 1987 meeting, the CRRL Board of Directors went on record to request that DOC recommend the use of IARU bandplans should deregulation occur. To place ARRL concerns on the record, President Larry Price, W4RA, sent a letter to CRRL President Tom Atkins, VE3CDM, with the request that our comments be incorporated in the CRRL filing (deadline for which was March 18).

President Price stated that DOC's proposals for privileges to be granted to foreign amateurs visiting Canada are quite generous, easy to understand, and adoption of these proposals would resolve some ambiguities associated with reciprocal licensing. The proposals for HF mode subband deregulation, however, appear to be based on an incorrect premise and raise serious concerns among US amateurs. The DOC states "Such an elimination of emission restrictions permits the Canadian amateur to enjoy equal privileges on a par with other radio users in the international radio environment and particularly with those privileges currently extended to US radio amateurs." At least with regard to US HF privileges, this statement is fundamentally incorrect.

Canadian amateurs already enjoy considerably greater freedom to use the most popular HF mode, SSB emission, than do their US counterparts. If the purpose of DOC's proposal is indeed to bring about equity between US and Canadian amateurs, then the proposal is unnecessary and should be abandoned or significantly modified.

The real question is how Canadian amateurs will respond to deregulation. We have faith in our Canadian brethren to act responsibly, if given the proper guidance. However, we believe that it is a responsibility of the DOC, in proposing to upset the existing equilibrium, to emphasize to its licensees the extreme importance of Canadian amateurs observing the voluntary band plans that have been developed through the representative international mechanisms of the IARU. We were disappointed to find no such reference in the notice, nor in the proposed regulatory text.

FCC PROPOSES NEW BEACON SUBBANDS ON 2 METERS, 70 CM

In response to an ARRL petition filed last September, the FCC has proposed, in Docket 89-65, to relocate beacon operation in the 2- meter and 70-cm bands. The ARRL petition had requested the changes since present beacon frequencies are very close to frequencies used for moonbounce and other weak-signal activities.

The ARRL filed the petition after consulting with weak-signal and beacon users.

The Commission said that it agreed with ARRL that the beacon subbands in the 2-meter and 70-cm bands should be relocated. The Commission followed the ARRL proposal to move beacon operation from 144.05-144.06 MHz to 144.275-144.300 MHz, and on 70 cm from 432.07- 432.08 MHz to 432.3-432.4 MHz.

The ARRL had also requested the Commission to change the beacon subbands on 220 MHz. But as expected, the Commission declined to propose changes in the 220-MHz beacon subbands at this time, citing its decision to reallocate the bottom two MHz of the 220 band to the Land Mobile Service. Comments on this proposal are due on or before June 12, 1989.

SPREAD-SPECTRUM SYSTEMS IN 902-928 MHZ

A number of inquiries have been received from members concerning the local-area network (LAN) use of spread spectrum in the 902-928 MHz band as

offered by Telesystems, Don Mills, Ontario, Canada; PA Consulting Group, Hightstown, NJ; and possibly by other suppliers.

Spread-spectrum systems, for LANs or other purposes, are permitted at a one-watt power level in the 902-928 MHz band as authorized under section 15.126 of the FCC's rules. Such operation is also permitted under this section in the 2400-2483.5 MHz and 5725- 5850 MHz bands. Of concern to amateurs is the potential interference from such operations to amateurs operating in the 902-928, 2390- 2450, and 5650-5925 MHz bands.

The rules place a number of limitations on spread-spectrum operation in these bands. The main point to bear in mind is 15.126(c), which requires that the spread-spectrum systems not cause harmful interference "to any other operations which are authorized the use of these bands under other Parts of the Rules." Also, they must accept any interference from these sources. This means that, as far as the FCC is concerned, the Amateur Service, and the Amateur-Satellite Service where applicable, both have priority over the spread-spectrum systems despite our secondary status relative to a number of other services in these bands.

On the practical side, it is unlikely that these spread-spectrum devices will cause harmful interference to amateurs except where they are physically close to the spread-spectrum transmitter. Interference from spread-spectrum devices, watt for watt, will be at least an order of magnitude less than from narrow-band transmitters in the same frequency bands. Because the modulation rate of these transmitters is much higher than the audible range (66 kbit/s in the case of the PA Consulting system), any interference should not result in an audible output of an amateur radio (voice) receiver. Desensingcould occur, but only in the "near" zone.

Spread spectrum system designers are cautioned by FCC to keep the potential high EIRP emanations from government radars in mind when developing their designs for these bands, and are also cautioned that the one-watt power limit on 902-928 MHz operation may be reduced in the future.

FCC ACTIONS

The FCC Commissioners have upheld their Private Radio Bureau's decision denying Anthony Sivo's (W2FJ) request to amend the amateur rules to authorize single sideband in the 30 meter band. The Commissioners agreed with the Bureau's conclusion that the need for SSB transmissions in the 30-meter band "had not been established" and there were already ample HF frequencies available for SSB emissions.

The FCC also denied a petition (RM-6559) which would have allowed Technician class operators to use F1B emissions (teleprinting, packet) in the Novice/Tech segments of the 80, 40 and 15 meter bands. The petitioner, Nicholas Sayer, N6QQQ, said that the additional privilege for Technician operators would be an incentive for Novice operators to upgrade.

The Commission said that the Technician class is currently the fastest growing amateur class, and there was no need to offer additional incentives for Novice class operators to upgrade to the Technician class.

Additionally, "the opening of these small segments to such a large number of stations for teleprinting, moreover, could have a serious negative impact upon their usefulness in providing an opportunity for Novice and Technician class operators to improve their telegraphy skills sufficiently to qualify for a General class operator license. Such a result would be undesirable because the General class shows the slowest rate of growth."

The Commission noted that Technicians could upgrade to the General Class and by doing so, could obtain access to the HF bands for F1B emissions. Thus, the Commission felt that to adopt the proposal "would actually have a negative impact of removing some of the incentive to upgrade from Technician Class to General Class." The Commission denied the petition on March 2.

And finally, the FCC's Private Radio Bureau denied a petition by Shannon Cisco, WB4AZT, to change the amateur operator license requirements for senior citizens. Cisco had requested that amateurs over 65, licensed for 20 years, be automatically upgraded from Technician to General, General to Advanced, or Advanced to Extra Class respectively, without any examination. Cisco appealed the Order to the FCC Commissioners, who upheld the Private Radio Bureau's decision.

WORLD TELECOMMUNICATIONS DAY

Every year on May 17 the International Telecommunication Union (ITU) celebrates World Telecommunications Day.

This year's topic is "International Cooperation." It is aimed at underlining the necessity for the world telecommunications community to enlarge the scope of international cooperation to meet the challenges of tomorrow.

The ITU was founded in 1865 under the name International Telegraph Union, and is the oldest intergovernmental organization. It became a specialized agency of the United Nations in 1947, and currently has a membership of 166 countries.

FCC TERMINATES RECEIVER ADVISORY LABELING PROPOSAL

In May, 1988 the FCC proposed amending Part 15 to require labeling radio receivers to advise users that it may be unlawful to intercept radio communications protected by the Electronic Communications Privacy Act (ECPA) of 1986.

The FCC said that although the ECPA prohibits interception of certain classes of communications, the frequencies on which these communications are transmitted can be used for unprotected communications as well. The FCC decided that, given the complexities of the ECPA, it was impractical for a label to provide sufficient information to properly advise users of the legal requirements.

The FCC also said that it agreed with some of the commenters that, in some instances, a warning label might encourage prohibited activity by calling attention to it.

Lastly, some manufacturers are voluntarily informing users of ECPA provisions or by redesigning equipment to omit certain frequencies. Thus the FCC concluded that an advisory label on radio receivers was unnecessary and terminated the proceeding, Docket 88- 281.

AURORA STRIKES NEW ENGLAND

Speaking from the perspective of one who has seen the aurora (Northern Lights) up close and personal -- your Editor is originally from Northern Minnesota -- the effect in Connecticut is equally spectacular, as aurora is rarely seen this far south in New England.

Talk around HQ lately has centered on the "lights in the sky" and there are, of course, different perspectives. The nonhams perceive the spectacle as "absolutely beautiful -- color hues ranging from orange to white and moving like a curtain in the wind." The hams see the aurora from a totally different perspective. Avid DXer Paul Shaffer, KB1BE, tells us that the "spectacle" has effectively killed communications on 20 meters. In his words "I now have a chance to catch up on recorded TV movies!" The active VHFers, however, have another story to tell! Propagation on the higher frequencies is tremendous in auroral conditions. There are a number of avid VHFers out there who are very familiar with propagation during auroral periods; results on VHF frequencies when aurora is active are something to tell the grandkids about!

MIAMI FCC FIELD OFFICE MOVES

Effective immediately, the Miami field office of the FCC is now at:

Rochester Building, Room 310
8390 NW 53rd Street
Miami, FL 33166
Recorded phone information (305) 592-0399
Public phone (305) 526-7420

NEW ADDRESS FOR HAWAII QSL BUREAU

Effective immediately, the new address for the Hawaii QSL Bureau is:

Hawaii QSL Bureau
PO Box 788
Wahiawa, HI 96786

W1AW RENOVATION CONTINUES

The renovation of the Maxim Memorial Station W1AW is progressing on schedule. There are trailers, construction workers, and other "implements of construction" scattered about in the area of the building. W1AW code practice and bulletins are now emanating from "W1AW Mobile One" -- a trailer located in the area of the original building.

> The proposed rewrite of Part 97, which has not by any means been
> approved, would allow retransmissions of weather radio only.
>
> Current rules prohibit retransmissions of any radio service other
> than amateur. However, you can tape record the other service
> and the retransmit over amateur bands. (or feed through a
> phone line!)

Two common interpretations of the rules about this that I have heard are:

1. Anything that has been over any other radio service at any time is not legal for amateur retransmission.

2. Anything that is being sent over any other radio service cannot be retransmitted at the same time.

The rules are not particularly clear about this, nor are any official opinions that I have heard so far. In the worse case, if you pick up the local weather feed at the point of transmission by telephone, and it arrived there by a microwave link, that was constitute being on another radio service.

Hopefully the new rules will be less ambiguous and come down in favor of the flexibility we need, i.e. to allow retransmission of weather information and other needed services, TO amateurs. Although so many new VHF radios have the capability to receive WX radio, most radios still in use do not, and radios on other bands do not, have access to 162.55 and nearby weather frequencies.

ROSE SWITCH ON

The long awaited ROSE (RATS Open Systems Environment) X.25 Packet Switch software has been released by The Radio Amateur Telecommunications Society (RATS). This release of the ROSE Switch software runs in a TNC 2 (or clone) or in a PacComm DR-200 two-port controller. TNC 2s may also be operated in a "back-to-back" configuration. The software was written by Tom Moulton, W2VY, and is free, for Amateur Radio use only. It may be obtained by downloading it from CompuServe's HamNet (filename: ROSESW.ARC).

from J. Gordon Beattie, Jr, N2DSY via CompuServe's HamNet

TAPR FOCUSES ON ON-GOING PROJECTS AT ANNUAL MEETING

The board and members of Tucson Amateur Packet Radio (TAPR) met on February 24-26 in Tuscon, Arizona, to discuss activities of the past and forthcoming year. Heavy TAPR support, both financial and technical, for AMSAT's MicroSat project has been the major activity of the past year, followed closely by the digital signal processing (DSP) project (see Gateway, Volume 4, Numbers 4, 8 and 12 and Volume 5, Number 10). While the MicroSat project should be winding down after launch in a few months, the DSP project should "ramp up" toward production of DSP units.

Other TAPR projects discussed at the meeting included modem upgrade retrofits for the TNC 2 and an upgrade to the TNC 1 to allow it to run TNC 2 firmware (see Gateway, Volume 5, Number 9).

Numerous talks were given, including updates on TexNet, TCP/IP, MicroSat, DSP and the HF message-forwarding network. Technical talks introduced a prototype IBM PC plug-in compatible intelligent packet-radio controller by Mike Chepponis, K3MC; a DSP-based analysis by Dan Morrison, KV7B, of filter-type vs phase-locked loop FSK demodulators; and prototype 1.2-GHz transverters designed by Glenn Elmore, N6GN, for use with WA4DSY 56-kbit/s modems.

The theme of the weekend, or, at least, the most discussed subject, was TAPR's support for some type of new Amateur Radio license class that does

not require a knowledge of Morse code. The TAPR board of directors, which met on the 24th and 25th, appointed Harold Price, NK6K, to oversee the generation of a specific proposal by TAPR. That proposal is to be forwarded to the ARRL No-Code Study Committee.

Newly elected TAPR board of directors were announced:

Franklin Antonio, N6NKF;
Bdale Garbee, N3EUA;
Steve Goode, K9NG;
Eric Gustafson, N7CL;
Lyle Johnson, WA7GXD.

by Jon Bloom, KE3Z

CALL FOR PAPERS: ARRL COMPUTER NETWORKING CONFERENCE

The eighth ARRL Amateur Radio Computer Networking Conference will be held on Saturday, October 7, 1989, at the Air Force Academy in Colorado Springs, Colorado. Technical papers are invited on all aspects of Amateur Radio digital communications via ionospheric, tropospheric, meteor-scatter and satellite modes. Topics may include network development, architecture, protocols, standards, hardware, software, modulation and encoding schemes, applications, frequency planning and practical experience, such as traffic handling. Of particular interest are digital signal processing, digital speech and image transmission, and new space programs employing digital communications.

Prospective contributors should request an author's kit and identify the topic of their paper immediately. The deadline for receipt of camera-ready manuscripts is August 28, 1989. Author kit requests and camera-ready manuscripts should be mailed to Lori Weinberg at ARRL headquarters.

Printed proceedings will be available at the conference and by mail from ARRL headquarters.

PACKET RADIO IN WEST GERMANY

In the following exclusive Gateway report, Ekki Plicht, DF4OR, the official in charge of visual communications for Deutscher Amateur Radio Club (DARC), describes the state of the art of amateur packet radio in the Federal Republic of Germany, where it is one of the fastest growing, if not the fastest growing, Amateur radio mode.

In the Beginning...

Packet radio in DL-land started on one 2-meter frequency, 144.675 MHz. While some enthusiasts enjoyed a quiet frequency and made connections through the whole country, even DX contacts into France, Switzerland and Austria, the growing interest in this new form of communications made efficient "normal" digipeating impossible, due to the increase in the number of collisions. So, in those early years, DARC started to develop a plan which would offer reliability and promise for future years. This plan stated that

o On 2 meters there are too few frequencies for packet radio (exactly three for digital communications);

o Therefore, user input frequencies should be placed on 70 cm and higher;

o Internode communications should take place on 23 cm and higher and the link between two nodes should be exclusive and realized with directional antennas and the lowest power possible.

This scheme developed well, although some people still favor 2-meter operation due to availability of less expensive equipment.

To understand the situation in West Germany, let me explain some of the more important differences between West Germany and US. The 2- meter band is much smaller than in the US (only 2 MHz, from 144.000 to 146.000 MHz). Digital communications occur from 144.625 to 144.675 and 145.300 MHz. This is not enough for a network, since there are still other digital activities besides packet radio, such as RTTY, FAX, etc.

On the average, West Germany is more densely inhabited than the US, thus, a digipeater has to serve a greater number of users. To avoid collisions between digipeaters serving different areas on the same frequency, they should not be located at good DX sites. Therefore, it is necessary to install a large number of medium-range digipeaters in order to build a nationwide network. This is possible only on 70 cm, where enough room is available (10 MHz, 430.000 to 440.000 MHz). (There is no 220-MHz band in Region 1, and 6-meter operation is not allowed in West Germany.)

The Situation Today

In early 1989, 74 digipeaters and 24 PBBSs are active in West Germany. Three digipeaters are still on 2 meters, the so called "NORD><LINK experiment." These are some of the earliest digipeaters in West Germany which were set up to learn about utilization of the 2-meter band for packet radio. Except for one station on 23 cm (a user input), all of the other stations are on 70 cm. The subbands used on 70 cm are:

o 433.625-433.775 MHz: simplex, digipeater, station-to-station

o 438.025-438.175 MHz: simplex, PBBS, digipeater, station-to-station

o 438.200-438.525 MHz: duplex output, 7.6-MHz shift, digipeater (not yet in use)

Duplex digipeaters are preferred for their improved throughput and collision avoidance, even though they consume twice the space. Besides, they are a perfect way to defend our endangered 70-cm band. (For a fair presentation of the situation here, it must be said that ATV operators are not happy with the frequency allocations in the upper part of the 70-cm band.)

All nodes use 1200-bit/s modems on the user frequencies with one experimental station near Bonn using 4800-bit/s. Most digipeaters are connected to some other node via 23-cm links. There are still some links on 70 cm, but they will be moved to 23 cm or higher when possible. The

23-cm links are on exclusive duplex frequencies, so collisions should be minimal.

The necessity of using 23 cm for internode communication led to some interesting developments in UHF equipment. To name one, there is a reasonably-priced, one-watt transceiver kit developed by DF9IC and DL5UY from Karlsruhe, that is capable of 1200-bit/s, half-duplex operation. It is ready to connect to a 1200-bit/s AFSK modem and covers the 23-cm band from 1240 to 1300 MHz.

Many experiments are taking place on higher frequencies. For example, in the Munich area (Bavaria), some experiments are in progress using the 6-cm and 10-GHz bands.

PACKET RADIO IN WEST GERMANY - (Part 2)

Modem Hardware

Besides the standard 1200 bit/s modems using TCM3105, AMD7911 and XR2211 chips, there are other modem developments. DJ4ZC of AMSAT-DL has developed the "RSM-Modem" which uses rectangular spectrum modulation. It is capable of 9600 bit/s full-duplex operation and is under test on two digipeaters. NORD><LINK's DK4EG has developed a 4800-bit/s modem. Elsewhere, tests are being conducted with G3RUH's 9600-bit/s modems.

Digital Hardware...on Hilltops

About 50% of the digipeaters in West Germany use standard TNCs including many compatible clones of the well-known TNC 2. Most, if not all, use NET/ROM or TheNet.

Another large number of digipeaters use the so-called "RMNC" (Rhein-Main-Network Controller) which was developed by DH1FAB and others in Frankfurt. It uses the 6809 microprocessor and is contained on one printed circuit board that includes the CPU, 32-kbyte of RAM, 32-kbyte of ROM, SCC, VIA and a TCM3105 modem. It is available at a reasonable price.

A few digipeaters use homebuilt hardware or software. For example, the HP9000-series computers with homebuilt slot modems used in the Stuttgart area running UNIX, another 6809 system running FLEX, etc.

A large number of hams use the Commodore C-64 for packet-radio operation running DIGICOM>64 Version 2 software and an inexpensive user-port modem. Another large chunk of the packet-radio population use TNCs, PK-232s, KAMs or similiar controllers.

Digital Hardware To Come

Rumors concerning recent new hardware developments include a larger CPU for the RMNC by DG8FAC and another board for the RMNC using the H16-series computers by DK7WJ.

Software...on Hilltops

Nearly all of the TNC-equipped digipeaters use NET/ROM or TheNet. Plans are to further improve TheNet as far as code-space considerations will allow. The latest development for TNCs is a converse-mode EPROM from DL8ZAW which is linked to a NET/ROM node via the EIA RS-232-C interface.

Software that is available for the RMNC (RMNC V1.6) includes a simple tool that uses an unchanging routing table in EPROM with no hop-to-hop acknowledgement or connectability.

Another software design is DK7WJ's FLEXNET. It has a lot of capabilities including hop-to-hop acknowledgment (without changing the SSIDs), an information system, MHeard list, converse mode and more. Currently, it is used on one digipeater equipped with professional hardware (6809 multiprocessor), but it will be ported to the low-cost RMNC, resulting in the Version 2 of the RMNC software (whenever I finish the low-level I/O).

In Karlsruhe, DL5UY/N1EOV and DJ0VL developed their own software running on an 68000 OS-9 system, incorporating a PBBS, standard digipeating and TCP/IP facilities based on KA9Q's software.

DK5SG developed another program under UNIX, running on a HP9000 series computer, which includes a PBBS, autorouter and, again, TCP/IP based on Phil's code. This is the so-called "WAMPES" (Wuertemberg Amateur Packet Experimental System). It is currently used by four or five stations in the Stuttgart area. WAMPES now has an extension which makes it compatible to NET/ROM-like internode communications (Layer 3/Layer 4 protocols). FLEXNET (and, by that, the RMNC) will follow by the summer of this year. Thus, we hope to get a consistent network all over the country.

The DARC department for visual communications will try to bring the major software developers of central Europe together for a conference where standardization and extension of the Layer 3/Layer 4 protocol will be discussed.

Software at Home

Many hams use the famous DIGICOM>64 software for the Commodore C-64/C- 128 computers written by DL8MBT. Its capabilities and user interface is nearly unbeaten by any other software. It is also used in the US as well.

People who use TNCs are running TAPR (V1.1.4) or WA8DED (V2.1) firmware. The latter software has been rebuilt by the NORD><LINK group and is available under the name "TheFirmware." It has some nice improvements (clock, MHeard, KISS-mode) and is mostly used as host- mode software.

There are some host-mode programs for the IBM PC, for example, TURBO HOST by DL1BHO, PCT by DD6CV, and CTERM by DD5KZ. All of these use windowing, file I/O and enhance the TNC with many features. For the PK-232, there is PC-PAKRATT.

Most of the mentioned software and firmware is public domain. There is a little TCP/IP operation in West Germany, mainly in regions where a TCP/IP PBBS or digipeater is reachable. (One digipeater in West Germany is running KA9Q TCP/IP code.) Nevertheless, several hams have improved the

KA9Q program with windowing (DK3SI) and other features (DK8GD).

PACKET RADIO IN WEST GERMANY - (Part 3)

PBBS Software

Until about a year and half ago, the WA7MBL PBBS software was used throughout Germany. But, then DF3AV, from the NORD><LINK group developed PBBS software called "DIEBOX" or "TheBox." Its greatest advantage is its multiuser capability that can handle up to eight users per TNC. This was badly needed for the crowded PBBSs serving hundreds of users in various regions of West Germany. Its store-and- forward scheme is compatible with the WA7MBL/W0RLI standard. The user interface uses a completely different approach than the WA7MBL PBBS. Another feature is its "lifetimer" which keeps the amount of information to a reasonable size. The average throughput of some mailboxes is approximately 75 Mbytes per month.

PBBSs running under UNIX or OS-9 (DK5SG and DL5UY) use improved WA7MBL software.

Packet Radio on HF

On HF, one mailbox is in operation: DK0MWX on 14.099 MHz. Most of our international traffic is handled through this mailbox, but, because of some legal uncertainty with third-party traffic, no direct contact is made between West Germany and US. We hope that will change in the future.

Many private stations are on 20 meters and should be operating below 14.099 MHz. The latest IARU Region 1 HF conference, held in late 1988, announced that a 100-kHz subband on 10 meters is allocated for narrow-band FM packet radio. This is from 29.200 to 29.300 kHz with 29.250 MHz as the center of activity.

Other Activities

A regular packet-radio conference is held in Frankfurt once a year. This meeting was attended by approximately 150 people last year, mainly PBBS SYSOPs and hardware/software developers. A beginners' conference was also held in Frankfurt in 1987 and should be repeated this year.

A software conference with a small circle of "gurus" is badly needed to catch up with the fast development of new software everywhere. It should ensure compatibility with all of the new programs without stopping anyone from writing new software or reinventing the wheel for the n+1 time.

The Future

We are far from having nationwide coverage by a packet-radio network, but the path seems clear. The number of new licenses for digipeaters has decreased a little, but some regions have not yet come on-line.

What we need now is to improve internode communications by means of hardware and software. The expected interest in packet radio indicates that the 1200-bit/s links are not fast enough. Roughly, about 10%

(5000-plus hams) are QRV on packet radio and the number is still growing.

Again, to give a complete picture of the situation in West Germany, it must be said that not everyone is content with the concept that DARC has for packet radio. Also, there are people who think that packet radio has nothing to do with good ol' ham radio at all and should be abandoned altogether. Admittedly, packet radio is not everything the beautiful hobby of ham radio can give us, but for many people it is one of the most fascinating parts of it. And, if we keep on talking with each other, there should be room for us all.

Is the operation of a radio transmitter in the Amateur bands, by a dealer to demonstrate the proper operation of a radio being offered for sale, when the potential buyer is a licensed ham, and the employee is also a licensed ham, both holding privileges to operate the frequency/emission/power being used, legal?

Since the operation is (potentially) profitable to the dealer, this is most likely illegal as "business communications". However, it could be legal for the potential customer to operate the radio instead. No dealers I have found will operate a radio like that for you. Some have told me not to operate even though I was prepared to show that I was licensed, until after I bought the radio (was this a legally conservative position or a form of sales pressure?).

I would like to see a rule provision added that specifically made an exception to the "business communications" provision that allowed for certain types of dealer operation. The provisions could require:

1. The actual operator be currently licensed for the radio emissions.

2. The operator be either an employee of the dealership or the customer.

3. Transmissions shall not mention the business nature of the operation, but shall operate it as a "test" operation. Proper ID of the operator is of course required. The name of the dealer shall not be mentioned.

4. Transmissions shall be brief and limited to the time necessary to show the proper operation of the radio equipment to a potential customer.

Does anyone have any information or opinions about any of this?

--phil ka9wgn--

CB started on 465 mhz AM. It proved to be a colossal bust. They then tried 27 mhz because it was the highest available ISM band for which cheap equipment could be put on the market quickly, "available" meaning they had no more important long range plans for it.

For those looking for a place to eat AWAY from Hara Arena, I came across a very good one last year (now it will probably be jammed packed this year). It is called "The Ivy Restaurant", and is is an old brick building covered with Ivy. It was probably an ice house or something, and is on one of the main roads on the North side of Dayton. It is across the street from Whitman's Bike Shop, and near a corner with a stop light.

They served regular american food (I think), but they had a really good selection of Cajun food, and it was really good. The place was nice and not too expensive.

360. Fox Hunting Update

Newsgroup: rec.ham-radio
Date: 1989-04-03 14:51:14 UTC
From: Michael_Edelman%Wayne-MTS@UM.CC.UMICH.EDU
Message-ID: <131479@Wayne-MTS>
Source record: 19301

Went out on my first hunt as a hunter last weekend, and finished
third out of seven, and tied for lowest milage. Not too shabby. The
fox was exceptionally crafty; he hid about a mile behing a local
office center consisting of a number of tall buildings covered with
metalized glass and aimed a 2m Boomer (!) between two of the buildings.
A lot of the hunters- ourselves included- assumed the stong signals
from the buildings *had* to be a reflection, and so spent a lot of time
looking in the *wrong* direction for the fox. He also fooled a few
hunters with his tape recording of a dog barking, which brings up
rule #1: Never pay attention to the audio!

Bob NW8R, the fox, also played a little havoc with us by using
horizontal polarization. (Ever try to mount a 15-el Boomer on top
of a car with *vertical polarization?). He also varied power from
150mw to 80 (!)watts. That played havoc with people trying to guess
range from signal strength. My favorite was his announcement that the
hunt would be to find the antenna, as opposed to find the fox. Once
you found it, it was a little obvious.

We brought along a loop sniff box but didn't need it; we did everything
with a 4 element beam attached to a 1" dowel, sticking out of KB8GHY's
Toyota van, with me in the back spinning the beam. Other equipment was
my FT-23 HT (nice s-meter) and an attenuator I picked up for $7 at a swap.

Our only really funny move was when N8FZT charged into an house with an
"Open" sign out front and when running around with an HT, much to the
confusion of the realtor. About 40 yards from the fox he almost
climbed into a large dumpster to check for a hiding fox, but we drove
another 10 feet and spotted the Boomer. N8FZT is one tough ham.

On the other hand, one team took a straight bearing and beat the
entire group in finding...our local repeater site. Names have been
ommitted to protect the guilty.

If you have access to packet, you might try to see what files are in your local big BBS. Connect to it and do a "dir" to get a list of files you can download. My local BBS has several files related to modifications. If your local board doesn't have files on modifications, you could do
GETDIR *.MOD KD6TH and you'll get a list of the files of mods that this BBS has. Then you could do GET <file>.MOD KD6TH to actually get the file. But try your local boards first to avoid loading KD6TH with too much traffic. 73 de WA2ISE

362. Someone Please Post/Email Recent OSCAR-9 CCD Image Data? Beg, Beg.

Cross-posted to: rec.ham-radio,sci.space,sci.electronics

Could someone kindly post the data from the OSCAR-9 CCD image that
was recently taken. I do not have the equipment to receive it.

If someone could please, pretty please, post the data. I'll
gladly do the work to convert it to Postscript so I can print it.
I'll also gladly share the Postscript file if I have any success.
Uuencoded is FB.

This will make a nice Amateur Radio Club presentation topic too; thanx
in advance. I'm sure that other netters would chomp at the bit, to
print a satellite image on their laser printers!

So, please, please, pretty please with sugar on it, can someone post
the image data? I'll even mail you a cat or three for the effort!
Postage paid! (I have 3 cats-- ie. 3 too many!)

Many of our HT's contain a Lithium cell for memory backup, and those
with TR-2400's and similar vintage gear will soon be replacing them.
The RSGB magazine Radio Communication warns of a potential expolosive
danger.
The cell contains Thionyl Chloride, which is both volatile and toxic,
any attempt to force current back into these cells results in a large
explosion. Most rigs protect against this with a series diode, but
when replacing them on your shack bench, exercise extreme caution...
A word to the wise!!!!

366. Just Say No to Radio Shack

Newsgroup: rec.ham-radio
Date: 1989-04-03 18:40:05 UTC
From: dfrandin@pro-sat.cts.com
Message-ID: <8904032136.AA24374@crash.cts.com>
Source record: 19288

I've been monitoring the discussion here on the net regarding Radio Shack's customer-relations problems...I'd like to relate a story that happened to me, from an employee viewpoint... About 2 1/2 years ago, I was unemployed, and saw an ad in the paper for a PC repair technician position at the local Tandy Business Products Service Center. I applied, and was interviewed, but was informed by the manager that he was planning on hiring me, but he was required to offer the job to a former employee who was currently working at the LA shop, The other employee had expressed a desire to transfer to San Diego and so, the manager was bound to offer the position to him. Thus I waited about 3 weeks(??!!) until I recieved a call from the manager stating that the offer was refused and I would start the following Monday. I was employed there for 3 days less than 6 months, when my manager called me into his office and told me he had to let me go, because he had to give the position to another person. He stated that he was against the transfer but his boss, the regional manager ordered him to do it. This employee who was to be transferred was the SAME one who was offered the position almost 6 mo previously..My local manager told me that his boss told him that 'either he goes or you go'...Obviously _I_ went...Not being a 'problem' employee AND having the second highest production rate in the shop, I was NOT laid off for disciplinary reasons, according to my local manager. Apperently there was some 'good_ole_boy' stuff going on here....Several letters were sent to the CEO and Computer Services Director in Ft. Worth, and the result was obvious....So the point here is: Not only don't be a customer of RS but don't be an employee either!

BTW: Another 'gotcha' from RadioShack...A form that you sign when hired by them. You give rights to _ANY_ software you write, to them during your

employment with them. Although, you also sign a form that revokes the first

form if you are employed by them in California......

All_in_All, I learned MY lesson!!!!!! Caveat Emptor!!!

367. Novice Question

Newsgroup: rec.ham-radio
Date: 1989-04-03 18:41:23 UTC
From: dfrandin@pro-sat.cts.com
Message-ID: <8904032136.AA24378@crash.cts.com>
Source record: 19289

A FCC rules question for the net:

A repeater group that I belong to has a 1.2gHz remote base with an autopatch and 220 and 440mHz output. My question is: Can a novice, who has privileges on 1.2gHz ,use the autopatch, and/or function the remotebase to 220, and use it to carry on a conv-ersation on 220? Everyone we ask locally seems to give us a conflicting answer. We would like to get novices involved on 1.2gHz ... The 1.2 repeater activity is very small here. Our group has the second 1.2 repeater in the local area, and the only one with any 'features' on it. Admittedly the price on 1.2 FM gear is still quite high compared to 220 gear, but if we get more activity, maybe the price will go down (???)

Anyway, we have several novices who are waiting with baited breath for an answer.....

Sorry to bother people about old info but I wasn't interested then:

I now have the Ham call-tape and would like to know what the fields
are before I remove most of them when I load it to disk. How big is
it total (I think/guess/was told it is about 100 meg)? Is the
old-call info of any use?

Thanks

Message-ID: <12600049@silver>
Source record: 19291

The second annual informal meeting of _SPELEONICS_ readers, LF/VLF experimenters, and hams interested in cave exploring and "cave radio" will be held at the Dayton Hamvention on Saturday, April 29 at 11 AM local time.

Place: Seats (!) above the main indoor arena (big room containing major manufacturers' exhibits), in the South corner, behind DARA booth (to right of main entrance), top level. A carbide lamp will mark the spot. Show/tell, trade equipment, share information (including flea-market locations of interesting items), or just say hello. Bring lunch if you wish (recommended; hamfest food is awful! :-(* We will monitor 147.64 MHz, RFI permitting.

370. Packets (?) in aviation band

Newsgroup: rec.ham-radio
Date: 1989-04-03 22:01:00 UTC
From: commgrp@silver.bacs.indiana.edu
Message-ID: <12600050@silver>
Source record: 19292

While using my PRO-2004 to search the civilian aviation band (118-136 MHz), I heard packet-like transmissions on 131.55 which may be data communication with aircraft in flight. Are they AM or FM? Can a TNC decode them?

BTW, airline "company frequencies" in the 129-132 MHz band segment are often more interesting than general air-band fare. Conversations with airport terminals and national dispatch centers describe aircraft mechanical failures, baggage loaded on wrong planes, and (sometimes bizarre) problems with passengers. There are also consultations with company meteorologists, discussions of holding-delays and diversions to alternate airports, and occasional arguments with managers.

>
>I was disgusted to find the icom rapid chargers used such a crude method.
>You can feel the batteries are quite warm after a charge-up.
>
>73
> Paul K. Rodman

You're right: Heat is the enemy.

As the NiCad heats UP, the voltage goes DOWN. By using this negative coefficient, you can tell when the battery is charged. This method charges the NiCad about 3% longer than the -d^2V/dT^2 method. With a simple peak-detector circuit, I have charged batteries in 20-30 minutes (yes, 2C to 3C) without them heating up. (BTW Paul, I'm interested in seeing that -d^2V/dT^2 circuit of yours.)

The ICOM battery frier's 's only value is the plastic shell and the transformer. Caveat emptor: Never buy a charger from a company that makes money selling batteries.

Forgive me for being so archaic, but I seem to remember an article in some early QST about computer control of ICOM 720A HF rig. I think it may have been sometime in '83. I had given up looking for the issue, but recently discovered our library has them (dating back to 1922!) stashed away here. Now I can't seem to find where I wrote down the issue number. If anyone is familiar with this article, any pointers would be greatly appreciated! (I have been scanning tables of contents, but haven't run across it yet...)

Thanks,

- Kurt

>THE BAND COULD BE HAZARDOUS TO YOUR TICKET.

What about the 2 meter band segment from 145.8-146 ?? I've been listening to the general beacon at 145.810 USB and heard rotten QRM comming from FM simplex being used at 145.9 ! I tried to break these operators for 10-15 mins before finally getting their attention, they were completly unaware of the bandplan and refused to move upband. What can be done about this??

I have logged the incidents and could provide complete info assuming there is someone who is serious about doing something about it. I have been told by a few O.O.'s that a letter to our ARRL Section Manage is not going to be worth doing...is the FCC interested?? Would AMSAT care?

Help!

376. TAPR's alleged filing with FCC

Newsgroup: rec.ham-radio
Date: 1989-04-04 01:52:39 UTC
From: dave@toth.UUCP
Message-ID: <8904040152.AA27967@julian.uwo.ca>
Source record: 19299

Despite what was reported to the group by Phil, KA9WGN, TAPR has filed zilch/nada/{}/zero/not a thing with the FCC. I do not know what Phil thought he heard in the Westlink Report, but I read the text of the report and it says that "In support of the position of AMSAT, TAPR, and Barry Goldwater, K7UGA, a group in Melbourne, FL (club name not remembered by me)" ... has filed a petition with the FCC.
TAPR is formulating a position paper that we plan to submit to the ARRL committee studying the code-less licence proposal.
I trust that this clears up any misconceptions that Phil had, or that may have been caused by his accidental misinterpretation of the report.
We did understand that the audio quality was a little rough on this report.

>According to Westlink, TAPR and K7UGA filed a petition with the FCC to
>establish a no-code license. This proposal creates the "Apprentice"
>class which requires the Novice written exam but no code exam.

CORRECTION

This is incorrect. The proposal you speak of was filed by the Space Coast Amateur Radio Club in Florida; it was NOT filed by TAPR, AMSAT or K7UGA. TAPR and AMSAT, on whose boards of directors I sit, have *NOT* filed any no-code petition with the FCC. The present policy of both boards is to work through the League's no-code committee while simultaneously developing support for no-code at the grass-roots level.

The Westlink report did begin by saying that the Space Coast group took its cue from TAPR and/or AMSAT and/or K7UGA, but Westlink's audio quality was unusually poor last week so I can understand how Phil H. or others might have misunderstood what was said.

Phil

Disclaimer: I am no expert on Part 97, but from what I recall.....

As long as the emissions from the Novice-controlled radio (the 1.2 radio)
are within the legal frequency boundaries, he or she is fine. I remember
reading about this: a novice was curious if he could transmit on 220, while
the repeater he was using rebroadcast over 2m. The answer was YES: the
novice was completely legal in his transmission; the 2m link was being
rebroadcast by the repeater, with the repeater's call sign.

Remember, too, that a Novice is not allowed to be a control op. for a repeater.

379. New product -- ICOM IC-R9000 receiver

Newsgroup: rec.ham-radio
Date: 1989-04-04 08:29:28 UTC
From: kawai@csli.STANFORD.EDU
Message-ID: <8387@csli.STANFORD.EDU>
Source record: 19317

New product report -- ICOM IC-R9000

Icom has announced a new communications receiver, the Icom IC-R9000. This is a base station receiver, resembling the IC-781 HF transceiver in size and in design. The IC-R9000 has a 5 inch orange color CRT in its center, which not only functions as a spectrum analyzer, but also displays commercial TV broadcasts and amateur TV communications in monochrome. (The TV reception unit is standard.) The CRT can also be used as a subdisplay for RTTY and PACKET, via a DATA-IN connector. The CRT displays frequency, mode, memory channel contents, and 2 date/times, via a menu-driven interface, as the IC-781 does. There is a built-in timer and a CI-V control port.

Reception coverage is as follows. Frequency coverage from 100 kHz to 1999.8 MHz continous. Modes are AM, SSB (USB/LSB), CW, FSK, FM, and WIDE FM. The reference crystal oscillator is accurate to plus-minus 0.25 ppm at 1.2 GHz. The PLL uses DDS (direct digital synthesis). A digital AFC circuit automatically tunes in to the center of the receiving signal. Sensitivity is flat throughout the covered frequencies. The receiving frequency can be selected either by VFO or by keypad. The VFO has 10 tuning increment steps (10 Hz, 100 Hz, 1 kHz, 5 kHz, 9 kHz, 10 kHz, 12.5 kHz, 20 kHz, 25 kHz, 100 kHz). If the tuning increment is set to 5 kHz or more. a click sounds when the VFO is turned,

The IC-R9000 has 10 banks of memory with 100 channels each, giving a total of 1000 memory channels. Various scanning modes are provided:
(1) program scan -- scans up to 10 groups of preselected frequencies in order, continously
(2) priority scan -- switches between the currently received frequency and the selected frequency in memory
(3) memory scan -- scans a selected bank, or all channels
(4) mode-select memory scan -- like (3), but scans channels which share a specific signal mode
(5) select memory scan -- scans channels specified by group number
(6) auto-write scan -- automatically writes the frequencies in which activity was found into memory, along with date and time
(7) delta-F scan -- scans a specified range of frequency above and/or below the currenty received frequency
A VSC (voice scan control) system stops scanning whenever communication audio signals are found in a frequency. An optional speech recorder feature announces the frequency when the VSC stops scanning, and records its output into audio tape. Four different scanning modes can be interchanged quickly. (The last feature is unclear to me.)

Dimensions: W x H x D = 424 x 150 x 340 (mm)
Weight: 20 kg

Price and release date are to be announced.

Information taken from an Icom advertisement and a brief product preview in "CQ Ham Radio", March 1989 issue (CQ Shuppan: Tokyo). There is a table of specifications in this magazine; if any of you are interested, send me a note.

From: julian@bongo.UUCP
Message-ID: <156@bongo.UUCP>
Source record: 19303

In the May 1989 edition of Popular Communications is a "Letter to the Editor" on the Radio Shack PRO-34 Scanner. Below is the text of that letter.

PRO-34 Scanner Modification

In regard to the information presented (March Issue) on the handheld Radio Shack PRO-34 scanner, my own observations on the modifications have been:

1. To restore missing 800 MHz frequencies, remove D-11.

2. To add 66 to 88 MHz (European Coverage), install a diode at D-9.

3. D-10 must remain in place for full 800 MHz coverage.

4. If a diode is added at D-13 it cuts out aero band, also seems to affect 800 MHz channel spacing.

5. D-12 added dosen't seem to have any affect.

6. Only D-10 and D-11 are factory installed.

I wish to thank you for a fine and informative magazine. I have had much reading enjoyment.

Absolutely, If the repeaters are linked together then is is perfectly
legal for the novice to do something like transmit and receive on 220
which is being simultaneously received and transmitted on 2 meters. The
justification is something like this. The novice is only transmitting and
receiving on his/her allocated frequencies. The repeater is transmitting
and receiving on its allocated frequencies, covered by the trustees license
which allows tranmitting on 2 meters (or whatever). Sort of like running
a phone patch, even though the person talking doesnt have a license it is
being controlled by a licensed operator.
We have a hardlinked 220/2m repeater here in denver being used daily
by novices and others alike. WD0FVV/R 147.225 is the call and freq. I dont
remember the 220 freq right now. But in any case it is perfectly legal.

What happened to 146.52? Isn't this the National Simplex Freq. ????
If you happen to pass through the Willamette Valley in Oregon, you'll
find there are a lot of hams who monitor this frequency.

In Corvallis, Benton County ARES monitors two repeaters (146.78 & 147.16)
and 147.47 simplex, which we use for all our events in the local area.

I have been seeing quite a few mods for the PRO 2004. But none for the
PRO 2021. I even saw someone ask if there were any. I'm not sure if I
missed the replies or there weren't any. So, I'll ask again.
Are there ANY mods that can be done to the PRO 2021???
I know it's not as great as the 2004, but I like it.
Thanx in advance.

392. antenna stacking - question

Newsgroup: rec.ham-radio
Date: 1989-04-04 19:20:43 UTC
From: kawai@csli.STANFORD.EDU
Message-ID: <8394@csli.STANFORD.EDU>
Source record: 19316

Dear all,

I have a question regarding stacking antennas. Is it a bad idea to erect a vertical or ground-plane antenna on top of the mast of a yagi beam? Imagine the following situation, which is what I actually plan to do:

* I have a flat roof, made of slab concrete, with fiberglass coating for weatherproofing.
* I erect a 4.5 meter (15 feet) high roof tower, made of high-durability aluminum.
* I install a rotator unit.
* I install a mast.
* I install a 10-15-40 meter 4 element triband yagi beam.
* I install a 6-2-0.7 meter triband ground-plane on the mast above the triband.

Will the trinband interact somehow with the ground-plane? Will there be any adverse effects?

All info most appreciated,
>goh, kawai@csli.stanford.edu, kc6bqm<

stjhmc!stjhmc.fidonet.org!ddodell@asuvax.asu.edu requested info on specific frequencies for airline company traffic. Reply wouldn't go.

Identifying airline company freqs by user is not easy because they seldom mention their names. One possible clue is airport gate numbers if you know the layout at the airport. Another is to go plane-watching at a major airport and take your scanner along.

My approach is to band-scan 129-132 MHz until I collect about 30 active frequencies, then load them into scanner channels for faster scanning, and wait for clues from context. If I am busy away from the scanner, I set it to one of the most active channels and turn up the volume.

A few airline freqs are listed in _Police Call Radio Guide_ available at Radio Shack. _Popular Communications_ and _Monitoring Times_ may have published lists; I have no references.

Major airlines probably have national frequencies, some of which are shared by commuter airlines (possibly subsidiaries of the majors). Some freqs are used by more than one airline. A company called Aeronautical Radio Inc. (a.k.a. Airinc; see previous response from Bob Parnass) provides phone patches and other radio services to airliners in flight. One of Airinc's ground facilities is at Dayton, Ohio.

A few freqs which I have tentatively identified:

129.2 American Airlines
129.5 Delta
130.65 Military Airlift Command
130.7 Eastern
129.625 TWA
131.925 Federal Express

Having just purchased an Icom IC-32AT dual-band handheld, I am now sorry I didn't keep a copy of the earlier rec.ham-radio article reviewing this rig.

I do have a copy of the SV1IW mods, but I am also wondering if anyone who has actually applied them might be able to list the specific part numbers for the diodes referred to in SV1IW's article. I am particularly interested in "opening up" the UHF coverage.

Thanks,

Phil

My opinion is best expressed by two rhetorical questions:

Don't you have anything better to do than to propose nonsense like
this? Have you ever heard of even one incident of the FCC citing anyone
for "unlawful business communication" as you claim?

> A word to the wise!!!!

I seriously question whether lithium/thionyl chloride batteries are in fact used for memory backup in any commercial or amateur portable radio.

It is far more likely that the chemistry is lithium/manganese dioxide or lithium/iodine. While batteries using these two chemistries may conceivably explode if used improperly, the potential danger is orders of magnitude less than with lithium/thionyl chloride.

From: roblingelbach@cup.portal.com
Message-ID: <16696@cup.portal.com>
Source record: 19313

Last Sunday night 70 mph winds blew 3 antennas down from my flat roof, and
I'm considering bolting the tripods to which they are attached to the roof.
This is a rolled, "composition" roof, and I believe if I fill the drilled
holes with roofing cement, then sink the bolts, then cover with more cement,
I'll not have problems with leaks. Any input from anyone on this method?
Guy wires will be replaced too, but I think the bolts will help.

Source record: 19320

rochester!rit!cci632!cb@cu-arpa.cs.cornell.edu (Curtis Braun) asks for travel in Europe info....

<...F I travel to France, Austria, Switerzland etc, do I nned a license for each country?...>

Check with the ARRL, but almost certainly, YES. There is a common license agreement among the CEPT countries, but it does not apply to US license holders, and may not apply to reciprocal holders.

<...If I take a 2m HT, what do I need on mods, power (bring 30w pa?)...>

No mods needed. The Region 1 2m band extends from 144-146 MHz (i.e. 2Mhz smaller than US). All repeaters are -600kHz shift (in low, out high). Many need a toneburst (wish I could remember the freq!) to wake them up, then are carrier accessed afterwards. You can generate the burst by whistling at them, generally. Bring the 30w PA if you want to carry it, but you won't need it in urban areas.

<...Is a 2m enough, should I bring 440 (oops 430)?...>

Once again the Region 1 70cms band is smaller than the US one. I cannot speak for Europe but there is very little activity on 70 in the UK. I wouldn't bother.

Hope this helps (probably raises more questions than it answers!)

73,

Hugh Davies, G0CNR.

Just thought you'd all like to know:

A friend of mine, KA3NQA recently bought the RS 10m rig. He & his boss at WBZZ-FM (Chris is also a ham, but I don't know his call offhand) opened up the box and discovered, to no one's surprise, that the circuit board IS a UNIDEN board!

Now the better news: They noticed a LOT of "missing" components on the board, and are in the process of getting the service manuals etc. from Uniden (HR2510). And then, they're going to start modifying...

One this is apparent: 25W may NOT be the maximum power the rig is CAPABLE of, it appears that the final stage is "turned down to half way" according to Dave.

I'll keep you posted as I hear things.

Interesting...

What you hear on 131.55 is indeed packet radio. Aeronautical Radio maintains 200 ground stations around the country that feed into a giant X.25 computer network. Ever wonder where the flight attendant gets arriving gate info minutes before you land ? Via a terminal in the cockpit. Data such as engine tempature, winds aloaft, etc is downlinked via this network. All 200 stations operate on 131.55. For more info write:

Industry Activities
ARINC
Radio Operations, Bldg 2
2551 Riva Road
Annapolis, MD 21403

They may send you some interesting brocherures.

Source record: 19326

In reply to the question about novice use of the linked repeater: I believe
that any novice may use ANY repeater, regardless of the output frequency, as
long as the INPUT frequency of the repeater lies within the novice band.
My rationale is the following: The intent of the FCC was to allow novice
operators to communicate on FM, simplex and on repeaters. However, the
novice subband of 220 is 222.01 - 223.9. (In other words, the input freq's
of most repeaters, plus the entire simplex portion above 222.) So by operating
on any 220 repeater, the output of the repeater is outside the novice's
portion of 220.
Of course, novices are not allowed to be control operators of any machine
which has output outside of the novice segment of the band.

I hope this arguement also applies to the 1.2 gig band, but I am not active
on that band (who is?? :-) so I'm not as familier with the repeater splits.
But I do know the novice segment is from 1270-1295 MHz.

Thanks, Larry, for expressing my opinions exactly. I thought I'd let
the net rest a bit :-) but you hit the nail right on the head. Most
bonehead regulations we have to live with now are a result of some
knucklehead asking a dumb question of the FCC rather than using
common sense. Or maybe asking other hams. One FCC engineer I know once
said that the automatic response to any ham inquiry is "No". The rationall
is that since we are supposed to be self-regulating, they don't want to
fool with such blather.

Perhaps one could apply some common sense to this question of dealers?
Is a dealer demonstrating a rig "using ham radio for commercial purposes"
(to paraphrase)? Yes, but no more so than operating a Ham store in the
first place. Is he out of line in this case? In my opinion, NO. If
he gets on a net and announces a sale? Absolutely out of line. In any
event, this is something for HAMS and not the FCC to work out. I generally
take a pretty liberal view on most such things. If the intent is pure, then
I'll ignore the minor detail infractions.

What seems to me to the the strangest of all is that many of the people who
would nit-pick such points are at the same time members of a repeater club
that sells phone patch access. NOW class, which of THESE is illegal.
Extra points if your answer uses the phrase "common carrier"

> conflicting answer. We would like to get novices involved on
> 1.2gHz ... The 1.2 repeater activity is very small here. Our

I don't have my rule book in front of me, so I can't give the rule number, but the text states that a Novice cannot be the control operator of a repeater.

Does this mean that the Novice can't use the phone patch? Well, that depends.. We have had the same questions in our area..... Since all repeaters are supposed to have "control" operators for third party traffic (autopatches), if this control operator is on duty, the Novice could ask the "control-op" to bring up/down the patch... this should allow for the Novices to use the autopatch within the strictest interpretation of the rules... Of course, in an emergency a Novice should NOT hesitate to use the autopatch.

I for one, do NOT like to interpret the rules every which way... just apply them without "third generation" interpretation... ie: Novices cannot be a control operator of a repeater, bringing up/down a repeater autopatch is in effect, being a control operator, therefore, (unless other provisions are made for) Novices should NOT be the control station that brings an autopatch up or down (not this does not say that Novices cannot use a phone patch... they just cannot be the "controlling" station).

These are my own opinions as one who does NOT pretend to be an expert in part 97.

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS

SPRING FLEA AT MIT
Sunday, April 16, 1989
9AM-4PM

Come to the city for a great flea - plenty of free parking.

MIT's semi-annual electronics and ham radio
flea will take place on the Sunday of Patriot's
Day weekend again this year.

There is tailgate space for over 150 sellers and
free, off-street parking for 500 cars!

Buyers admission is $1.50 (you get 50c off if
you're lucky enough to have a copy of our flyer)
and sellers spaces are $6.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 4PM, with sellers set-up
time starting at 7AM. Have no fear of rain, a
covered tailgate area is available (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)

I believe that you heard an ARINC digital radio service
which is called "ACARS" or something similar. It is a packet
digital radio service, operated by ARINC, and used on a
pay-per-packet basis by many airlines. It is fast, 9600 baud
I think, but I don't know how it is modulated.
I suspect all technical specs are available from ARINC, which
is a sort of business/consortium for Aeronautical Electronics.

> place might not be worth spending an enforcement-agency's limited
> resources).

Technically, Communications Concepts doesn't sell kits. They sell
the PC boards shown in the Motorola Application Notes. They also happen
to sell the transformers used. In addition they also happen to sell
all the other parts needed. Not only that, they are a distributor for
certain Motorola RF transistors. So you simply order all the appropriate
parts (except ones that you may already have!) using the parts list
shown in AN762. You don't get an instrustruction manual like Heathkit
(you don't even get a xerox of AN762). You don't get a power supply, heat
sink, or cabinet, either. I guess they figure anyone who can work at
this level of detail probably has a ham ticket anyway.
(Freebander=appliance operator?).

Also, as others have mentioned, companies like ENI and Amplifier Research
will sell you a wideband RF amplifier if you can afford it.

Last night, I was looking around for interesting RTTY traffic and came across a digital mode that seemed to shift between mark and space in discrete intervals (at about 14.560 MHz). At first I thought it was a fax of a discrete tone photograph, such as might be produced from 3 or 4 plane computer graphics, but I could not hear the usual 250/500/1000 mS interval sync period. Needless to say, my PK-232 made no sense of it. Any ideas on what this might be?

From: hardie@dvinci.USask.CA
Message-ID: <1945@dvinci.USask.CA>
Source record: 19241

The toneburst frequency is 1750Hz +/- 5Hz and should last for about 500msec (according to my RSGB handbook). If you can find a copy of the RSGB handbook it has a crystal controlled circuit that can be used to generate the toneburst and is hooked into your mic input. Basically its a colour burst crystal oscillator and a cmos divider chip. Easy to make and I've fit one inside my FT-208R handheld. You only need the burst to bring a repeater up, so if you can't get one, you won't be able to call up a repeater, but once it's up you can answer other users. However, you will find that use of repeaters is (usually) quite different in Britain than it is in North America. Since the band is only 144-146Mhz (make sure you don't Tx out of band) there's not much room for repeaters so it is a common practice to QSY to a simplex frequency if you are within simplex range. According to the RSGB book the repeater channels are

name in out
R0 145.0 145.6
R1 145.025 all are +600
R2 145.050
R3 145.075
R4 145.100
R5 145.125
R6 145.150
R7 145.175
R8 145.200
R9 145.225

There are also standard simplex channels (named e.g. S20 etc) but I can't find the list.

Have fun over there!

I think that if you get a license from a cept country it is valid for
the other cept countries as well.
The following countries are CEPT countries:
The Netherlands
The United Kingdom
Austria
Belgium
Switzerland
West Germany
Denmark
Spain
France
Liechtenstein
Luxembourg
Monaco
Norway
Sweden.

The CEPT agreement has two different licenses.
A class 1 license which is a full license including HF
and a class 11 license which is only VHF and above (UHF SHF)
whith a max power of 30 watts.
The class 1 license has a power limit of a 100 watts.
The region two UHF VHF bands are
2 metres 144.0 to 146.0 MHz repeater shift 600 KHz down
The repeaters have their output between 145.6 and 145.8 MHz.
70cm 430 to 440 MHz repeater shift 1,6 MHz up (in holland)

(who admits to being "too lazy to look them up") writes:

> My atrophied brain can not recall the top and bottom
> ends of the [LF] band, but 100 to 350 Khz seems to ring a bell.

The limits of the LF broadcast band are 148.5 .. 255 kHz.

> There is
> also Navigation stuff here, in Europe a system called CONSUL used to
> be here, may well still be.

There are a supposed to be a few beacons in this band, but I've never heard any. However, Decca and Loran (to which he is probably referring) are at 70 .. 130 kHz (in round figures). This range is *below* the broadcast band. Consul is still transmitted from Stavanger on 319 kHz, which is *above* the broadcast band.

> Also most of the broadcast stuff here are
> standard freq stns as well.

NOT TRUE. There are rather few standard freq. stations in this band. Allouis (France Inter) is one; it used to be on 163.840 kHz (i.e. 2^14 * 10 Hz), but it moved to the much more boring freq. of 162 kHz ages ago.

> At 200 Khz is a BBC transmitter at
> Droitwich England it is dead nuts on 200 Khz so you can build an RX
> for 200 Khz and use it as a freq standard to run the lab freq counter
> etc.

NOT TRUE. Droitwich is on 198 kHz. It used to be on 200 kHz, but it changed. All Region 1 LF broadcast stations are now on multiples of 9 kHz (except for some "rogues" like Morocco on 173, but even that might have moved now), to reduce the severity of heterodyne whistles.

Droitwich *is* very stable & accurate.

Incidentally, Allouis is a standard time station, as well as a standard frequency station, as well as a domestic broadcast station. The phase of the carrier is advanced and retarded at regular intervals, to indicate the time-of-day.

>flattening out *before* the batteries start heating up.
>
>I was disgusted to find the icom rapid chargers used such a crude method.
>You can feel the batteries are quite warm after a charge-up.

Heat sensors built into battery packs for rapid charging are a commercial
standard. The cells used in such batteries are specially designed to
handle the heat and pressure and can withstand years of such use. Circuits
that rely on voltage change with charge don't work well with nicads.
Temperature is a very reliable end-of-charge indicator. Motorola has been
using this system for years. The commercial rapid chargers that I've seen
that didn't use temperature used a *TIMER* instead (including some models
of Yaesu chargers) and had *NO FEEDBACK* from their charging batteries.
Better make sure the batteries are completely dead before using one of these.
If anyone is aware of other rapid-charge systems successful in manufactured
products I'd certainly like to hear about them. There have been many
articles on other systems for charging batteries but many of them have been
downright dangerous.

Subject: More of G6WBJ's Budget Antennas.

'Slim Jim' Antennas for VHF applications
==

The following diagram shows a practical 'slim jim' antenna (derivative of
the 'J-pole') with cutting details for popular frequencies (i.e. 'Lo-band',
aircraft and marine frequencies).

The antennas do not require radials, and provide a low angle of
radiation, whilst at the same time being relatively tolerant to
surrounding metalwork.

Best construction materials are either copper or aluminium tube.
I have made the 70MHz one using copper water pipe
and a range of solder-in cappilary plumbing fittings!

(a word of warning - DO NOT, repeat NOT, attempt to bolt together aluminium
tubes with BRASS nuts/bolts - they form an electrochemical couple
in the presence of moisture - the aluminium will corrode seriously)

Use a short length of plastic rod (Nylon, Tufnol) machined to the
required size, to bridge the gap 'E'.

=============================================================================
```

Construction - i made mine out of copper tube (see your local plumber or airconditioning specialist - they often have offcuts available cheaply), with the ends beaten flat and joined by a length of threaded rod inserted into another length of tube bolted through the flattened end. The important thing is to obtain good electrical contact - soldering the joint after bolting it all up is recommended (the bolts provide mechanical continuity, solder provides the electrical continuity).
Attach the coax feeder initially using alligator clips and slide them up/down the elements to obtain the best SWR or strongest received signal.
To mount the antennas, either hang them from a hook by a length of nylon cord (i use the aircraft-band one for portable expeditions hanging from a branch of a tree!), or make up an INSULATED mount to clamp to a pole. The important thing is not to short together the elements, or to accidentally ground one or both in the mounting arrangement.

The whole thing can be scaled for other frequencies - i am working on a version for 430-460MHz at the moment - looks like it will come out about 22 inches high!

Happy Experimenting!

429. IONCAP and propagation predictions

Newsgroup: rec.ham-radio
Date: 1989-04-06 17:30:04 UTC
From: stu@tandem.Tandem.com
Message-ID: <425@tandem.Tandem.com>
Source record: 19252

Hi,

Does anyone have experience with a propagation prediction progam called IONCAP ? - its available from the WWV folks at Boulder (least, thats what the address says !).

I have used MINIPROP and have a review comparing MINIPROP against IONCAP (the latter being acredited as the best there is) which shows MINIPROP is very close in its predictions to IONCAP.

What I'd like to know is whether IONCAP takes the A and K indices into consideration; MINIPROP only uses the solar flux or sun spot number which doesnt take into account the adsorbtion effects on higher lattitude paths when the A index is high.

Please e-mail replies to stu@tandem.com, USENET {sun|pacbell|ubvax}!tandem!stu.

If I find the answer, I'll post a summary of the replies.

Happy crystal-ball gazing !
Stuart (N6TTO, G8HQA)

431. Request for TS940 mod

Newsgroup: rec.ham-radio
Date: 1989-04-06 20:34:56 UTC
From: AFZ1@PSUVM.BITNET
Message-ID: <80034AFZ1@PSUVM>
Source record: 19255

I read sometime ago that the 940 can be made to transmit out of band by just clipping one diode. I've misplaced my notes and would appreciate it if someone could e-mail to me which diode that was. Thanks in advance.

432. IC-32 review/mods?

Newsgroup: rec.ham-radio
Date: 1989-04-06 23:23:56 UTC
From: faunt@CISCO.COM
Message-ID: <8904062322.AA09101@ucbvax.Berkeley.EDU>
Source record: 19256

Has anyone have a mod to the IC-32 for transmitting in 430 to 440, in addition to 440-450? I'd like to be able to hit 433 to 435 for auxiliary operation.

433. HF rigs: IC-725 vs IC-735

Newsgroup: rec.ham-radio
Date: 1989-04-06 23:34:14 UTC
From: faunt@CISCO.COM
Message-ID: <8904062332.AA09582@ucbvax.Berkeley.EDU>
Source record: 19257

Has anyone figured out what advantage the 735 over the 725 or vice
versa? It looks like pretty much of a wash to me.
They're advertising the 725 as being ultra-compact, but it's the same
size as the 735. The 735 is triple conversion, and the 725 is double,
except for FM.

> ersation on 220?

The answer is YES! A novice does this every time he uses a repeater on 220 or 1200 Mhz. Remember that the OUTPUT of the repeater is not in the novice subband either! The output of a repeater falls under the licence of the trustee of the repeater. When a ham ID's through a repeater he is only identifying his own emissions ie. the INPUT to the repeater. Therefore, a novice may transmit within his own subbands, and have his transmission be recieved and re-transmitted by a repeater or remote base without concern for what band(s) the signal is re-transmitted on. The same concept applies when a technician licensee uses a remote base with a 440 input and 29Mhz FM output. The output of a repeater or remote base is sort of like third party traffic the emissions need only conform to the license class of the repeater trustee.

Why can't we have a place to go when we're tired of walking. I have a friend that meet at the stuffed parrot in the concession area on the one end of the complex. Maybe we could meet behind the antenna dealer in the main arena up in seats up there I know I will be wearing a black baseball cap with a blue F.B.I emblem on it. Maybe a banner or a stuffed animal to denote the place for us. I realy don't think a formal meeting is what anyone wants.

DAY-TON me too!!!

>stupid than the Code War. Rage on, guys, I love it!!!

I did the original posting, and I have checked back on ParaNet Alpha (1-303-431-1343) to see if there has been any further information. The original poster noted that immediately after he announced the incident on Compuserve that discussion group crashed for about 15 minutes, which he claims "never happens".

As I have said, my rule in fringe stuff like this is, "read everything, believe nothing."

This is the third time I have placed the ANARC SWLnet monthly loggings on
the Usenet. (cross-posted from CompuServe). I have not received any negetive
comments on this posting practice -- I have received a few positive postings.
Since this file is in excess of 30K, I would like some responses from people
who are interested in this file (to justify the bandwidth). If there is not a
lot of demand I can easily place this file on an accessable server (via FTP,
like the Simtel20 Ham section). Please reply to one of the e-mail addresses
below, and indicate your preference. (the best path to use is
kingdon@cunixc.bitnet or kingdon@cunixc.columbia.edu)

73's,
John Kingdon

>
>No mods needed. The Region 1 2m band extends from 144-146 MHz (i.e. 2Mhz
>smaller than US). All repeaters are -600kHz shift (in low, out high). Many
>need a toneburst (wish I could remember the freq!) to wake them up, then
>are carrier accessed afterwards. You can generate the burst by whistling at
>them, generally. Bring the 30w PA if you want to carry it, but you won't
>need it in urban areas.

The toneburst should be 1750 Hz. Some repeaters don't require a toneburst,
just a carrier with voice.

Channel spacing is 25 KHz. You might need to bring down your FM deviation
a little. In crowded areas, 12.5 KHz is used.

The repeater channels are from 145.600 to 145.775 (thus input from 145.000
to 145.175.) You might find repeater activity on 145.800 or 145.825, but
these QRGs are abandoned in favor of the satelites.

Some other interesting channels:

145.500: general CQ frequency (no QSO, please!)
145.550: general mobile frequency
144.650, 144.675 (and others) Packet radio

Areas to avoid: 144.000-144.100 (CW), 144.100-144.400 (SSB),
144.850-144.9875 (beacons), 145.300 (RTTY), 145.800-146.000 (satelite)
and 146-up (our band stops here)

Hope this helps. Good luck!

It's not that you don't have some valididty in your position -- just remember that under ITU rules, you MUST possess "knowledge" of International Morse in order to operate an Amateur station below 30 MHz. The question is, is the code test (as we know it) the only way to meet this "knowledge" requirement? Think about it. So long as the FCC interprets things this way, tho, you must pass a code test to operate below 30 MHz. Period.

Don't have it either, but R8 and R9 should be obsolete by now (or very
soon to be) since they interfere with the satellite band. Also there are
channels between those above with an X suffix e.g R5X id 145.1375 in and
145.7375.

You'd better worry about WHAT the bolts are supposed to sink into before
indiscriminatly drilling holes. I don't know anything about flat roofs,
but shingled roofs usually have only 1/2 inch plywood under the shingles.
I suspect you have about the same kind of base with just more gunk between
the wood and the sky; if you don't hit the rafter with your bolt, it won't
do much good!

When I remodeled our house I put extra bracing where I planned on installing
a tripod (and then had trouble locating the bracing when I finally got
around to drilling several years later!-)

For what its worth, Media Network, on Radio Nederland last night (0030 GMT Fridays on 6165 & 15315 kHz), had a segment on the travelling-with-electronics-gear issue with regard to the terrorism/baggage search situation at British airports. (This applied only to that country.)

The discussion can be summarized as follows:

1. Travelling with electronic gear is discouraged.

2. If you take some, it should have batteries installed so it can be demonstrated to operate. (What if it isn't batery-operated?)

3. You should also take a screwdriver suitable for use for opening up the back of anything so they can look inside. (! I can forsee lots of broken HTs and/or voided warranties when some of the new micro-miniturized gear is torn apart by ham-fingered security types...)

4. Preferably pack it in a suitcase that is checked instead of carrying it. (This latter is different from other guidance I have heard elsewhere. Considering the known problems have come from radios packed in luggage, this makes little sense.)

What has never been stated, and for some reason nobody asks, is whether there is some sort of SIZE criteria for the electronic devices they are suspicious of. The Pan Am bomb was in a boom box, fairly large. Even though plastique is efficient, you can't get enough of it in a Walkman or a HT to do nearly as much damage, so why would a terrorist waste time on an ineffective bomb? So there should be some size cutoff in the searches or definitions of suspicious objects, but nobody ever mentions this.

They could probably make a woman's purse out of explosive plastic, fill it with detonators that look like cosmetics, cram it with assorted junk that was also fabricated from plastique, and blow an aircraft in half with that! Any terrorist who watched the news would know now to skip the "electronic device" disguise, especially when the security forces are concentrating on those now and letting other stuff by with less attention!

Date: 1989-04-07 16:20:47 UTC
From: wmartin@ST-LOUIS-EMH2.ARMY.MIL
Message-ID: <8904071524.AA23953@ucbvax.Berkeley.EDU>
Source record: 19270

> I still don't see terribly many receivers which tune to
> 1705 kHz, but many tune to 1620 or even 1630. Unless there are a significant
> number of receivers which can tune the new band, no one is going
> to apply for frequencies (except perhaps 1610, 1620, and 1630).

I certainly agree with this. The receivers that I have which are considered good AM BCB DX units, like the GE SuperRadio and the Radio Shack TRF, tune only a smidgen above 1600 kHz. The ones which DO tune above 1600 with ease, like the Sony digitals (2001, 2010, 7600D) are NOT considered very good for BCB DX.

Is anyone out there a member of one or more of the AM BCB DX clubs, like the National Radio Club or others? What has been in the newsletters of these clubs about equipment for DX when and if this upper band segment is activated and stations begin to appear there? Are current models of better AM radios being made which tune up to 1700 kHz, or have there been articles on adapting and modifying existing radios to cover that (without at the same time losing the lower end of the band!)?

I can see this range of frequencies staying unused in a manner similar to the AM Stereo fiasco -- Little or no receiving equipment on the market means the broadcasters won't be interested in investing in stations to transmit to non-existent receivers which means that the receiver makers won't be interested in producing receivers when there's nothing to receive which means that no one will set up stations.... and so on ad infinitum.

The other aspect I've heard about this has been that the existing Travellers' Information Stations now on 1610 will be forcibly moved to 1700 or 1710 or thereabouts. This is totally self-defeating, since few if any car radios tune up that high. (Do the digital ones even go to 1610? I'm a non-driver so am unaware of the details...) Anyway, it makes that service essentially useless if they are forced to operate in a region where most of their intended audience cannot tune them. Maybe some can move to 530 but then their coverage increases and interference becomes a problem.

All in all, it looks like another bad deal...

I don't know what you do at Intel, but lots of EE's here are electronics hobbyists who get paid for doing the kind of work they enjoy. I suspect that we probably make at least as much as the W1AW ops. :-)

> Why does it now cost $4.75 for license upgrade processing, none of which
> is for the local VE people who have to pay for supplies and equipment out
> of their own pocket?

The ARRL VEC supplies VEs with the test tapes, test booklets, forms, postage, etc. They also certify their VEs (VE manual, tests, badge, etc.) I think it pretty amazing that the small fee covers all that as well as their labor to develop and handle all that paper.

I think reimbursement of the few VE out-of-pocket expenses (e.g. gasoline) that remain would be hard to administer ("gee ARRL, of course I went to Dayton to help with the exams...") :-)

From: barry@hprmokg.HP.COM
Message-ID: <13770005@hprmokg.HP.COM>
Source record: 19266

Power supplies cannot be connected in parallel for more current. The problem is that their output voltages usually are NOT exactly the same voltage.

When this happens, one power supply "goes at war" with another, trying to make its respective voltage output the same. After all, their job is to attempt to make their output voltages constant (regulation). There may be some wierd power supplies out there that have programmable voltage inputs that could possibly allow parallel connection but these are not typical in low cost power supplies.

Excessive quiescent current is the result and possibly some strange oscillations.

You might try looking at the commercial surplus houses for high current, low voltage DC power supplies. They can often be obtained inexpensively through these means. Also, if you can find a high current transformer (low voltage) w/secondary voltage of around 20 volts or more at your desired current, the remaining components are quite enexpensive for constructing your own power supply.

And, of course, there is the "brute force method" of using lead acid batteries (sealed ones are nice) and an inexpensive automotive battery charger for the DC source.

There are probably other solutions out there so don't believe that the above methods are the only way to solve the problem.

453. FCC's recognition of repeater coordination is a disaster

Newsgroup: rec.ham-radio
Date: 1989-04-07 23:33:00 UTC
From: goldstein@delni.dec.com
Message-ID: <8904071934.AA29104@decwrl.dec.com>
Source record: 19275
Cross-posted to: rec.ham-radio,rec.ham-radio.packet

(originally To: DECWRL::"splut!jay@uunet.uu.net" in response to a dialogue on a mailing list)

Yes, Jay, it's not an easy question! How can coordinators make room for new services (i.e., packet repeaters) when FM users have already claimed all of the frequencies?

The problem is basically that YOU are being asked to decide it, rather than allowing the "forces of nature" to take their course. Let's go back a couple of decades to the last two major shifts in band occupancy.

Between 1955 and 1965, the HF fone bands went from mostly-AM to mostly-SSB. The first SSB pioneers got sneers of derision about their "Donald Duck" transmissions, but they crept between the carriers, found their niches, and spread out. Eventually the AMers shrank back to niches and today they have a single spot on each band. No coordinator made up a bandplan; the bands just evolved.

Between 1968 and 1971, 2M went from mostly-AM to mostly-FM. In 1967, I belonged to an AM net that met on 146.898, weekly, and to a "midnight net" that met on 145.71. Local activity was centered on 145.32. This was in Northern NJ, btw. The .898 net moved down to .71 by 1968 or so, as 146.94 got busier as the National FM frequency. Then the FMers filled up the 60 kHz channels from 146.94 to 146.64, then the "splits". The uniform 600 kHz repeater business took place around '71, creating the FM bandplan for 146-147. FM stayed above 146, though; OSCAR was to claim 145.8-146.0. And the FCC noticed and allowed Techs to move into the previously-empty space above 147. Eventually the AM retreated to niches around 144.3. That evolution was pretty smooth, except for the chaotic era of the Walkerrules.

I was the editor of 73 Inc.'s "World Atlas of Repeaters 1976". That was the first wide-ranging repeater atlas to feature maps. I did a LOT of work putting it out, checking hundreds of club newsletters, etc. I couldn't just ask the coordinators who was where; not every area had one, and not every repeater was coordinated. But there were only a few places where hams didn't work things out amicably. In the NY area, co-channel repeater spacing was sometimes as low as 30 miles. Yeah, they argued, but it wasn't all that different from 20 meters -- you try to avoid interference and understand that the bands are crowded. Or you have a repeater war for fun. (Why not? Many of the repeaters were totally redundant, just there for ego-tripping, so repeater operation was itself the thrill, not repeate use. And repeater wars are the Radiosport of repeater ownership.)

Eventually FM repeaters were allowed to claim the 144.5-145.5 band, and when packet came out, all that was left was the simplex space around 145.0. All of the repeater pairs had been given out (in many areas), by the time the FCC's coordination procedure was recognized.

Now the repeater wars of 1972 weren't all good (or all bad, really; I enjoyed watching some) but the FCC's recognition of coordination really stopped evolution dead in its tracks. Coordinators were no longer "voluntary", making their job tougher. After all, before, if you didn't like their decision, you could ignore them, and if the "free market" was with you, the coordination would become nugatory or moot. Now, though, they're effectively stuck playing Gosplan, allocating resources among competitive interests, with little or no market mechanism.

So what's a coordinator to do? Well, there are two approaches. One (which is rather idealistic) is for coordinators to declare their decisions "non-binding", legally, so they revert to their 1972-era standing. They could also declare some coordinations to be more binding than others, "protecting" only a critical backbone of repeaters, and "suggesting" frequencies to others on a purely voluntary basis.

Another is for the coordinators, in their unpleasant GosRepeater role, to recognize that FM voice users are no longer so preponderant on 2M (and elsewhere; I just know 2M better) that they deserve as large a percentage of the band as they did in 1979. New, non-voice allocations could then be made where voice allocations already exist.

Which exisiting allocations get booted? Well, in a "free market", the least-used and most private machines would be the easiest ones to, uh, "share frequencies with" and "encourage them to move". The 3-user PL-access machine on Joe Bxzftlp's roof 30 miles outside of town might be a good frequency to "share". So a coordinator would prioritize existing allocations and ask the low-priority ones to move. Maybe let someone offer to buy a new set of crystals.

Prioritization of amateur operation is no fun, but one could posit someting like this:

1. Open repeaters with high usage.

2. Closed repeaters with high usage.

3. Open repeaters with little usage and unique features.

4. Closed repeaters with little usage and unique features.

5. Open repeaters with little usage and no unique features.

6. Closed repeaters with little usage and no unique features.

7. Historical allocations no longer actively used.

Others might give more weight to openness; I tend to accept closed-ness if there's justification, such as experimentation. Individual coordinators, of course, would get to make up their own priorities and

apply them to the user base as they see fit. The low-priority allocations then have to double up on frequencies, or use closer co-channel or adjacent-channel distances to find new homes. That can free up a few repeater pairs for packeteers and other future users.

It's not an easy situation, but ham radio is stagnant enough without applying the Force of Law to maintain frequency allocations in a time warp simply because to change them would force some users to retune their radios or, heaven forbid, learn to share frequencies. I know from sad experience that 2M packet is a total mess, and I know from technical analysis that full duplex repeaters give far more than twice the throughput of single-frequency digipeaters. But to gain such efficiency, we need repeater pairs, and they're all full up.

That's why I think the FCC's coordination rules are a disaster. They can be changed, or the coordinators can recognize the problem and, at the risk of making a few enemies, do the tough job themselves.

>> 29.000 TO 29.510 MHZ IS SET ASIDE BY INTERNATIONAL AGREEMENT TO USE AS
>> A PASSBAND DOWNLINK FOR MODE A SATELLITES. WRONG USE OF THIS PORTION OF
>> THE BAND COULD BE HAZARDOUS TO YOUR TICKET.

>Is this actually illegal?

No, it's not actually illegal, but in the United States the FCC rules contain a small paragraph that states that amateur operations shall be in accordance with "good amateur practice". The FCC has been rumored to be willing to interpret that as meaning (among other things) that operations in conflict with a band plan that cause interference are not in good amateur practice, and are therefore grounds for a citation.

In practice, however, the FCC doesn't give a damn. Some years ago I had a long running battle with KU2E and a few of his cronies in the Queens area of NYC who loved to hold their interminable FM ragchews on 145.83, 10 KHz above the UoSAT 2m downlink. This persisted despite repeated pleas (in many forms) to move, letters to the FCC, letters to the League, etc. In the latter case, Dave Sumner declined to take a stand for the satellite folks, saying that he didn't want to broaden the artificial distinction between the Amateur Service and the Amateur Satellite Service. Perhaps, but somehow I think a satellite project that costs hundreds of thousands of dollars and a dozen man years of work and can't be retuned once in orbit ought to have SOME priority over a group of old farts too goddamn lazy to turn the knobs on their radios.

Source record: 19080

Has anyone had experience with the Kantronics monobanders? These
are single band 80, 40, 20, 15 and 10 meter rigs that sell for
between $320-$350. I had a brief chance to play with the 10m rig,
and it seemed *very* nice- much better than the Uniden et al. None
of this 100KHz "channelized" tuning, better filters, better rcvr,
and so forth.

Please post responses to the net; I think this info would be of general
interest.

In reference to travelling in Europe, plane security and walkie-talkies plus sundry other gear here are some randon thoughts.

I fly a fair amount and have had very few problems recently with getting a walkie talkie or laptop computer on board.

I have entered planes with my ICOM u2AT on my belt and yes most of the time the metal detector fails to detect it. I have also boarded planes with the radio in my carry on bag. Also in the bag is usually odd single cell batteries batteries, walkmans, battery packs, RS-232 cables etc. In the past I have heard one security drone point at an X-ray screen when my bag was going through and say: "That's a Rubber-Ducky". In St Louis in early January I was pulled aside and asked to open the bag. Yes, the bag with the wires and batteries and walkie-talkie. The security bi-ped placed her hand in my bag, felt my shaving kit and said: "Do you have a shaving kit in here." I answered in the afirmative and was allowed through.

The last real problem I had with electronic gear in security was last April at Heathrow (London) England. They refused to give me a physical check on my Toshiba Laptop unless I could open the case with a screwdriver and show them the guts. The floppies were physically checked, but the computer had to go through the X-ray machine. This was last April (1988). My opinion is that Heathrow has the most efficient security checks. They spot check people all over the place there.

Anyhow in summary, walkie talkies and any electronic gear seem cause little problem these days with security. As a side note, I have noticed a slight increase in security vigilence since the latest Pan Am attack. It will slack off in a month or so. When security people are minimum wage illiterates what do you expect. Recently in Milwaukee they were doing a physical check on all bags, mine, wires and all went through with less trouble than my girlfriends who had all the usual soiled kleenex, cosmetics, gum and debris.

As a side note, I have never had any problems caused by putting my Toshiba Laptop through airport X-Ray. I always get the floppies physically checked. Since my experience at Heathrow, I find it faster to slide the computer through the X-Ray machine than take it out of its case and show a little A> to a disinterested security dweeb.

Yours

Source record: 19085

I alway run my laptop, calculator, camera, walkie, blank film, tapes, walkman, and cassette tapes through the X-ray. About 1/10th the time they ask to look in the bag - probably when some combination of loose metal items starts looking like a weapon or something. Most of the time it's my collapsable travel umbrella that they want to see.

I have NEVER had a problem with dropped eprom bits, background film fog, erased floppies, lost high-frequency response on music, or missing bits on magtapes. There is no sign of magnetic influence at all.

One time I ran a running camcorder through the x-ray machine. Basically, it's dark in there. You should see what the magnetic-pulse stolen-library-book detector in our campus library does to the scan deflection in a vidicon camera though!

I never check luggage - the bagsmashers are just as likely to store my bag next to a magnetic latch as they are to lose it. In fact, the only time I've ever had problems with magtapes is when they were in checked luggage.

I suspect I'd ask for hand inspection of blank X-ray film, of course, but even 400-speed motion picture original didn't have problems.

459. IC-32 quasi-modification

Newsgroup: rec.ham-radio
Date: 1989-04-08 18:16:58 UTC
From: AXVSCCN@UICVMC.BITNET
Message-ID: <8904081827.AA07647@ucbvax.Berkeley.EDU>
Source record: 19084

I learned about a useful quasi-mod of the IC-32 that lets you see
the display better at night. There are two LED's on either side
of the display. As presently mounted, they cast a shadow across
the center of the display. Next time you have the cover off your
rig carefully push forward on the LED's until they make contact
with the back side of the plastic that covers the display. This
effectively elevates the LED's and allows them to cast a more even
light on the display. As with all mods, be very careful when
removing/replacing the cover so as not to damage the ribbon connector.

Hey There,

I will be heading back home (Houston area) in mid May, and would like to take (re-take) my General code test. Does anyone on the net know of any VE sessions scheduled in the Houston - Galveston area between late May and early August? Also, any pointers to groups planning field day in the area would be greatly appreciated.

TNX es 73,

Ivan (KB5BBD@W2XO, W3VC; IY03@andrew.cmu.edu)

Source record: 19087

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

From: cs313s31@uhccux.uhcc.hawaii.edu
Message-ID: <3698@uhccux.uhcc.hawaii.edu>
Source record: 19092

Every time a Novice's signal shows up outside of the Novice band (or mode) then a CONTROL OPERATOR must be PRESENT. Automatic control is NOT good enough. It's the same as a guest operator at your house... if Joe Novice wants to talk on 10 FM over your HF rig, YOU are responsible for Joe Novice's actions on your station. You MUST have control of your station at all times. It is permissible to give the PTT to the novice, but you must be able to quickly cease transmission if the rules are violated.

The new distribution address (and I suppose subscriptions as well)
for the JBH-ONLINE is LISTSERV@OHSTVMA.BITNET. They had some
distribution problems which stopped publication for a few weeks but
are expected to be back with a regular schedule beginning from
next Monday.
For those of you who are not familiar with this list I might add
that it consists mainly of a summary of international news broadcasts
(BBC, R. Netherlands, R. Australia etc.) monitored in South Bend,
Indiana by John Harlan. It's quite interesting to read but suffers
from an irregular schedule on account of being basically a one-man
operation.

465. Drake RR-2 Manual request

Newsgroup: rec.ham-radio
Date: 1989-04-09 02:38:28 UTC
From: PROVERO@WSMR-SIMTEL20.ARMY.MIL
Message-ID: <12484636849.21.PROVERO@WSMR-SIMTEL20>
Source record: 19091

1. Does anyone have a manual for the Drake RR-2 communications receiver? It seems to be a rack-mount, commercial version of their ssR-1 (I may be wrong on this one) general coverage receiver. The navy used them in ship's entertainment systems, and a number of them have been hitting the surplus channels recently.

Josh Rovero, KK1D [PROVERO @ WSMR-SIMTEL20.ARMY.MIL]

466. Tripods on Flat Composition Roofs

Newsgroup: rec.ham-radio
Date: 1989-04-09 05:52:15 UTC
From: COLE@BABETTE.ISI.EDU
Message-ID: <608107935.0.COLE@babette.isi.edu>
Source record: 19086

I have had a 10' tripod on an almost flat composition roof for about 12 years in Los Angeles. The person who pointed out the importance of fastening your anchor bolts into a rafter is certainly correct. I used 3/8" eye bolts drilled into rafters (or whatever the proper name is on a flat roof). I have two sets of guy wires, one attached about 6' up and the other about 10' up.

Finding the rafters was a lot of fun, because some of the area under my roof is inaccessable to anyone but a midget. In one place that was accessible I drove a nail upward from underneath at an angle so it came out in the center of a rafter. In the other two places I took a long thin nail and probed every 3" or so until I located a rafter. Then I filled the holes with roofing cement. If your attic is accessible you are in good shape.

I used 3/8" hex head bolts to fasten the tripod down. Since the roof does slope a bit (about 1 in 40), I used wood shims to level the tripod. Then I covered the bolt heads and shims with roofing cement. No leaks so far.

DON'T tighten the guy wires too tight. There is no need to put permanent stress on the system. When the wind blows they'll tighten up where they need to. My tripod supports a 4-element tribander about 13' above the roof with a discone about 3 feet further up. The rotator is mounted a couple of feet off the roof and the mast is a 12' length of 1 1/2" aluminum with 1/8" wall. This arrangement provides a nice torsion damper when you stop the antenna rotation.

Keep in mind I live in L.A., and this arrangement probably would fail in areas with simultaneous wind and icing. It has survived 60 mph winds, killer smog, and attacks by legions of pigeons.

467. Re: HF rigs: IC-725 vs IC-735

Newsgroup: rec.ham-radio
Date: 1989-04-09 12:50:05 UTC
From: bill@hpfcdj.HP.COM
Message-ID: <16740002@hpfcdj.HP.COM>
Source record: 19088

>Has anyone figured out what advantage the 735 over the 725 or vice
>versa? It looks like pretty much of a wash to me.

I just recently asked myself the same questions and this is what I found.
The 725 does not have qsk capability, and does not have provision
for an integral keyer. The 725 has what icom calls band stacking registers
which I don't really understand (maybe the last freq tuned to in each band
is saved as one moves from band to band). The 725 has quite a few more
memories also.

The most interesting thing that I heard as I called a few dealers around
the country is that the 735's passband tuning is going to be removed from
subsequent versions of the radio. Apparently, this is some kind of
patent infringement (this could very well be rumor, seems like it should
be).

So after looking at all of this I found a 735 with passband tuning and
bought it because the qsk capability was what I was interested in anyway.

Oh yea I also heard some mumbo-jumbo about the 725 already having some
interface to the mobile antenna tuner built in (at a price of about 350
to 500 bucks, this did not matter cause I won't own one). Of course the
new interface probably makes it a lot cheaper.

RTTY DX NOTES FOR WEEK ENDING 7TH APRIL 1989

IT HAS BEEN A BAD WEEK FOR DX1. I HAVE SEEN SOME OF THE NOTES THAT HAVE
BEEN TRANSFERRED BY PACKET, AND TO SAY THE LEAST, THE ERRORS HAVE BEEN
HORRIFIC. GENTLEMEN, IF YOU CANNOT PASS THE INFORMATION CORRECTLY, PLEASE
DO NOT SEND A MUTILATED COPY. THAT IS OF NO USE TO ANYONE.

DX WISE THE WEEK HAS BEEN FROM FAIR TO POOR, WITH THE END OF THE WEEK A
COMPLETE LOSS. MAYBE NEXT WEEK WILL BE BETTER.

OUR THANKS THIS WEEK GO TO TG9VT, W1DA, JA1ACB, OD5NG, I5FLN AND VK2EG.

Greetings,
At the recent ham-fest in Framingham, I recently exchanged a few $$s
for a Yaesu FT-DX-570 80-10m rig. It's equipped with the FV-401
external VFO, for which I have no documentation.

1) How does the VFO switch on the front-panel interact with the
external VFO?O?

2) What does the "normal/cross" switch on the VFO do?

471. re: airport X-ray inspections

Newsgroup: rec.ham-radio
Date: 1989-04-09 21:41:32 UTC
From: john@stiatl.UUCP
Message-ID: <4185@stiatl.UUCP>
Source record: 19096

I've been seeing some comments on the net lately about X-Raying
electronic devices at the airport inspection stations. the general
concern has been a) the X-Ray will damage {eproms, disks, chips} or
b) the magnetic field associated with the machine will do the same thing.

IN lite of this concern, I thought the net would be interested in a couple
of experiments I've done. The most severe involved INTENTIONALLY erasing
EPROMS with X-RAY. It failed. I was given a large quantity of plastic
pack, 1-time-only 27256 eproms that had been removed as part of a firmware
upgrade. If I could erase these things, I'd be into a bonanza.

I first tried a medium level gamma source in my laboratory. I administered
an estimated 500 Rads of radiation over a couple of days. Not a bit flipped.
I then decided to nuke it properly. I took an X-Ray tube used for XRF
experiments and taped an eprom to the exit window. This tube has a
Rhodium target and thus generates X-ray spectra near several absorption
edges of silicon. The first shot was for about 10 minutes at an estimated
dose rate of 1000 R/minute. No effect. So we turned the tube up full
blast and left the thing running overnite. This delivered a dose well in
excess of a megaRad. STILL no flipped bits. We then reasoned that heating
the chip might increase the mobility of the electrons enough to respond to
X-Ray. So we heated the eprom to about 80 degrees C and blasted it again for
24 hours. NOTHING. Not a single bit changed.

To put this dose in perspective, this X-ray tube will expose an X-ray of my
hand in about 5 seconds onto litho film without an intensifier screen.
In other words, hot stuff.

Moral: Nuke 'em til they puke and the EPROM will still be there.

In other experiments, I have made somewhat subjective measurements of the
effects of magnetic fields on floppy disks. About the only thing I've found
in common use that will affect a modern floppy is a strong magnet directly
applied. Degaussing coils (tv and tape), weak refrigerator magnets,
transformers, power supplies, ringing telephones (someone suggested it),
and walkman-type radios and headsets have had no effect. I've tested
both 5.25 and 3.5 disks. My general rule of thumb is that if you
cannot feel a strong tug from the magnetic source AT THE WORKING DISTANCE,
then you have very little to worry about. Remember inverse-square.

So feel free to put your laptop or whatever in the X-Ray machine. It's a
lot less hassle for both sides and is absolutely harmless.

73 john

From: kaufman@polya.Stanford.EDU
Message-ID: <8324@polya.Stanford.EDU>
Source record: 19100

In article <13770005@hprmokg.HP.COM> barry@hprmokg.HP.COM (Barry Fowler) writes:
>Power supplies cannot be connected in parallel for more current. The problem
>is that their output voltages usually are NOT exactly the same voltage.

I common hack here is to put 0.1 ohm or so (value depends on the power supply)
in series with the supply, before the voltage sense leads. Many supplies
will hang close to the desired voltage at full current before folding back.

475. HF rigs: IC-725 vs IC-735

Newsgroup: rec.ham-radio
Date: 1989-04-10 07:24:00 UTC
From: muellerm@inf.ethz.ch
Message-ID: <1493
Source record: 19101

I bought an IC-725 about one month ago. I chose that rig because I live in a place which is not well suited for HF operations (lots of large buildings in the nearby vicinity) and therefore cannot expect too much from HF.

The IC-725 is a much simplified version of the IC-735. However the simplification went quite far:

- No RF gain control, although the 10 db preamp and -20 db attenuator are still present. However the rig performs well enough that you will rarely miss it.
- No VOX control.
- No full break CW.
- Moderate filter performance. Mainly due to the fact that the circuit was reduced to a double superhet, with only one single filter fighting the QRM in the second IF stage.
- AM reception quality is very poor; lots of interference, heterodyne tones and intermod. Local strong station can be heard several 10 kHz off frequency. This is probably due to the use of a supercheap ceramical filter in AM mode. On the other hand, CW/SSB performance is great and comparable with the performance of the IC-735.
- Noise blanker performance is poor. Neither level nor width can be adjusted. The placement of the NB circuit at the first IF causes it to trigger on any pulse shaped signal within several 10 kHz of the reception signal, including local quality CW and SSB signals. On the other hand, it fights true pulsed noise like ignition interference quite well.

Hope that helps.

CEPT licences.
==========

recently it was stated on the net that 'CEPT licences are restricted to
30 and 100 watts'. This is not the case - i have a CEPT class II licence
and looking at the UK implementation thereof, my power ratings
are 26DbW for a majority of bands (with one or two exceptions like 160M)

Note that we in the UK at least measure power in DbW delivered TO THE ANTENNA
so if you have lossy feeders, you turn the wick up on the final to compensate
so that the legally limited power is delivered into the antenna. How you
are practically expected to measure this in realith i dread to think - who
puts a wattmeter at the antenna feed point! Most people calculate on the basis
of the published lossiness of their feeders at the frequency concerned, and
hope!
Anyway, we UK people are limited to 26dBW on most bands (thats about 400
watts PEP). Certain UK 'Privelige bands' (like 50 and 70MHz - yes we have
an allocation at 70MHz courtesy of Her Majestys Government) have power
restrictions and/or polarisation restrictions to prevent interference
with other services using these frequencies in other countries.

Re: Using switch-mode power units
==========

I have tried this - the following may be of interest::

1) Many such power units have a 'minimum load' current - typically 5% of rated load. Below this current, the regulation may be lost - in other words if your rig takes 100mA receive current and 15 amps transmit, you may find the output voltage goes up to 16 or 17 volts on receive and only stabilises to 13.8 (or whatever you have set) when you go on to transmit.

2) RF hash - since the power unit is a power oscillator, using a square wave, you dont need Fourier analysis to tell you that there will be harmonics - the one i tried produced a wonderful spectrum of harmonics at 62KHz intervals from 124KHz to well over 800MHz! Clearly the filtering of such beasties may be OK for computer applications, but not when you are looking for sub-microvolt signals six inches from the PSU.

3) RF susceptibility - the power units i have played with seemed easily upset by a few watts of RF in the vicinity - they lost regulation and went into all sorts of odd shutdown modes (overvoltage, overcurrent) when i operated my 1-watt handie-talkie on top of the power unit. I guess RF was getting into the power unit through the voltage sense leads, as a 1000pf capacitor from each 'sense' terminal to earth was the answer. Whether it would cope with higher power setups (tens or hundreds of watts) no doubt depends on the power unit.

Finally - a question. Why, oh why do the makers of ham gear insist on it being supplied at 13.8 volts?? Now we have power-MOSFETs that can run at higher voltages, lets have some designs for equipment that runs at the fifty or one-hundred volt level - the linearity would be *FAR* better and it would make power supplies and cabling cheaper - i need 20 amps at 13.8 volts for my 140-watt 2Meter linear, the same input could be achieved with 2.5 amps at 100 volts. Thinner cables, lighter power units, greater linearity! Come on all you manufacturers - lets see some decently priced gear built to professional standards for a change. The technology is there, whats holding you back?

Our Race Team has the standard business band radios and a current issue military headset with mike. We need someone who knows how to interface the headset with one radio and set-up the drivers helmet (which is a full-face) with mike and speakers. The driver rejects ear-phones, says sweat flows into his ears.

Is there someone out there that would know how to set this up, or know of anyone that can, or of a place to go to? We have one month to go before our first race at Limerock.

Please call (508) 794-4969 ask for Dave. or email this message

Thanks to any and all responses.

p.s. Racing is very expensive so we are always next to broke.

>Finally - a question. Why, oh why do the makers of ham gear insist on it
>being supplied at 13.8 volts?

Probably because there is no market. People won't buy it IMHO because
they wouldn't be able to run it in their car without an extra power
supply.

If you drive FAST enough, ALL the lights are green.

another battery alert from packet:
From: w3ccv@w3ccv.md.usa.na (Mike)

Recently a SAFETY_GRAM was circulated at one of my
clients and I think this should also be brought to the
attention of the Amateur Radio community.

-=-=-=-=-=-=- BATTERY ALERT -=-=-=-=-=-=-=-- A recent Safe
Alert warned fo the hazzards of mixing alkaline and carbon
zinc batteries. This combination created a pressure
explosion great enough to split and blow the end cap off an
explosion-proof flashlight.

The Eveready Alkaline Energizer was the only battery of the
seven different styles inspected that incorporated a warning
label concerning mixing battery types.

Also, it appears as though all major manufacturers are
converting from carbon zinc to alkaline which has increased
the hazard of mixing battery types, especially with the green
jacketed military batteries which contain no warning labels
of chemical description.

DO NOT MIX BATTERY TYPES

=-=-=-=-=-=-=-=-=-=- End of notice.
I suspect that this is a problem if they
are connected in parallel.

>
>Excessive quiescent current is the result and possibly some strange
>oscillations.
>

Well, this is only true for supplies that have active sinking capability.
These are extremely rare except for supplies meant for servo service.
The more common supplies which have only active drive circuitry will work
fairly well in parallel service. The secret is an effective current limit
in each supply. If the current limit on each supply is set to its rated
value and the voltages of each are set to match fairly closely, the
supplies will kick in cascade style, one at a time as current draw
increases.

What happens is when the supply with the highest voltage setpoint reaches
current limit, the voltage will sag and continue to sag until it hits the
next highest setpoint. This supply will then regulate until it saturates
and the next one will pick up.

Thus, each supply will supply its rated current to the load and the only
noticable effect will be a degradation in regulation dependent on the
matching of the voltage setpoints. As a practical matter, I've been able
to match supplies within a few millivolts. Such variance is insignificant
when driving radios or amplifiers.

One thing you do have to watch out for is supplies with foldback current
limiting. If the foldback region is hit before or coincident with the
current limit, oscillations are probable. the solution (where possible)
is to simply set the current limit a bit below the foldback point.

I will echo Barry's suggestion to use a car battery as a surge supply.
My current bench supply has a 50 amp, 12 volt supply in parallel with
a large truck battery. This is bussed to wherever 12 volts is needed.
I've set the power supply to 13.8 volts, just like a car regulator.
The battery maintains excellent regulation and needs water only about
twice a year.

Not to argue with what may be a reasonable request for higher voltage equipment, but the main reason "13.8 volts" is so commonly specified is that a "12-volt" automobile battery sits at/near 13.8 volts when fully-charged, and in a running automobile, the battery is almost always fully charged.

In other words, equipment needing that voltage input may be operated mobile with little difficulty.

Source record: 19102

I used to live in Japan where we had no land to put up antennas
and roof towers were in use by most everyone. They are great! Most
of the time we did not drill holes in the roof. They had "feet"
on a hinge with rubber bottoms that would adapt to the pitch of the roof.
We installed two sets of guys---one on the feet and the other near the top.
We tightened these down with turn buckles and the roof tower became SOLID
even for quite large antennas.

486. New Yaesu FT-470

Newsgroup: rec.ham-radio
Date: 1989-04-10 18:02:37 UTC
From: wjc@XN.LL.MIT.EDU
Message-ID: <1352@xn.LL.MIT.EDU>
Source record: 19111

I noticed, in the current (April ?) issue of Radio Communication, an advertisement from a British dealer for the FT-470 compact, dual-band (2 m & 70 cm) HT. A further check showed the ad had been running since at least the January issue. I called Yaesu last week, and they have sent me a brochure on the rig.

The physical design is very similar to the FT-411/811. The width and depth (55 x 32 mm) are the same, and the height is about 25 mm greater (164 mm with the FNB-10 battery). Weight with the FNB-10 is 420 grams. The keypad is essentially that of the FT-411/811. A few keys have been relabled, and there is an extra row of four more keys (of a different size and color). The top panel controls consist of the large "tuning" knob (the keypad can also be used for frequency entry) and two small knobs, one of which has a concentric skirt. Those last three controls are apparently (in some order) squelch, volume, and "band A vs. band B" audio balance. The LCD (and keypad) can be backlit and displays 5-1/2 digits of frequency on each band simultaneously.

Some other blurbs from the brochure:

Die-cast rear case/heatsink. Rubber gasket seals around all external controls and connectors.

Dual independent IF circuits for simultaneous reception on both bands.

Defeatable, programmable-interval power saver. Also, Automatic Power Off system that puts the radio "to sleep" after a selectable interval of keypad inactivity.

PTT lock in addition to keypad lock.

Bargraph S/PO meter.

Dual A/B "vfos" for each band and 21 memories per band. All memories store shifts or separate TX/RX frequencies. Each band has its own instant recall memory. Scanning at 14 steps (memories ?) per second.

Built-in 10 memory (15 digits per memory) DTMF autodialer. Transmitted DTMF tones are also heard through the speaker.

Built-in CTCSS decoder/encoder with some sort of PL paging feature.

Apparently no VOX.

The "hard numbers" are:

Frequency Coverage: 144 - 148 & 430(?) - 450 MHz
Channel Steps: 5, 10, 12.5, 20, & 25 kHz
Emission Type: G3E
Supply Voltage: 5.5 - 15.0 VDC
Current Consumption
Standby, 1-sec save: 8 mA
Receive: 150 mA
Xmit, 2 m, 5 W: 1300 mA
Xmit, 70 cm, 5 W: 1600 mA
Sensitivity, 12 dB SINAD: better than 0.158 uV
Adj. chan. selc., +- 25 kHz: better than 60 dB
Intermodulation: better than 65 dB
Audio ouput @12 V: 0.5 W @ 8 ohms for 5% THD
RF Output
2 m: 1.5 - 5.0 W, depending on supply voltage
70 cm: 1.0 - 5.0 W, depending on supply voltage
Freq. stab., -5 - +60 C: better than +-5 ppm
FM noise: better than -40 dB @ 1 kHz
Spurious emissions: better tha 60 dB below carrier

Has anyone seen one of these beasts? I have seen no advertisements in either QST or Ham radio by either Yaesu or dealers. So far as I know, even the FT-811 is still vaporware, although I have had one reported sighting of an FT-411 at HRO (nee EGE) in New Hampshire.

487. ETCO's successor found

Newsgroup: rec.ham-radio
Date: 1989-04-10 18:11:05 UTC
From: wmartin@ST-LOUIS-EMH2.ARMY.MIL
Message-ID: <8904101715.AA07492@ucbvax.Berkeley.EDU>
Source record: 19113

The May '89 Radio-Electronics "Hardware Hacker" column has a brief discussion of several suppliers of surplus and other electronic merchandise, and a table of addresses. On page 76, the writer describes this firm as the "channeled reincarnation" of ETCO:

Surplus Traders
Winters Lane, Box 276
Alburg, VT 05440

(514) 739-9328

That's the total info. The firm did NOT advertise in that issue of R-E, so I have no other idea of their range of products or prices. Unfortunately, R-E didn't give reader-service numbers for the firms listed in that table of suppliers, a rather annoying omission for a magazine that provides reader-service "bingo" cards.

Hope this is of help to the people who were seaching for ETCO.

Regards, Will Martin

488. Cellular eavesdropping in the press

Newsgroup: rec.ham-radio

Message-ID: <8904101918.AA14015@ucbvax.Berkeley.EDU>
Source record: 19108

The following item appeared in RISKS Digest V8 #52 and is of interest to Telecom and Hams. Please note there is no mention of the ECPA in this, except fo a slight allusion to it at the end. Also note that the equipment being used is not a high-end 800 MHz-coverage scanner, but a simple TV audio tuner or radio. Obviously a continuous-tuned TV will work as well. (Maybe the bandwidth on this simpler equipment is wide enough that the listeners get multiple cellular frequencies without retuning, and therefore are not impeded by the frequency-hopping during handoffs within conversations? That would mean this low-tech method was actually better for surreptitious eavesdropping than using more sophisticated equipment. Certainly makes fools of the scanner manufacturers who program out cellular coverage!) -- Will Martin

Begin included item
Date: Fri, 07 Apr 89 20:27:24 -0400
From: denbeste@BBN.COM
Subject: Cellular telephones

From the 4/7/89 Boston Globe:

"Some Bostonians are having the time of their lives eavesdropping on Nynex Mobile Communications cellular phones. With the help of their trusty Radio Shack Portavision 55s, designed to pick up the audio portion of UHF television signals, these naughty people claim to have heard Secretary of Finance and Administration Edward Lashman discussing a press conference with his wife and Boston Mayor Ray Flynn checking in with his office. "It makes for a great day," says one listener who calls in sick at his job to spend the day with his ear pressed against the radio. "At 7 a.m. you hear the construction people complaining that their suppliers delivered the wrong stuff. At 9, it's the lawyers telling their clients how to lie in court. After noon the risque stuff starts..."

The article goes on to say that Radio Shack no longer sells that model, and that the FCC says such eavesdropping is illegal.

This used to be a major bone of contention with me. I have talked to Mike Stahl K6MC, ex owner of KLM inc. and Dave Andersen president of T E Systems K6QDD about this in the past. Both have manufactured linear amps for VHF and UHF. Both agreed with me that linears using 48V or 100V devices are easier to design and build, are inherently more linear, would possibly be cheaper, require much simpler and cheaper power supplies because less current and less stringent regulation are needed.

Both also said there was no market for such a device because most hams do not have the skills to homebrew a 48V or 100V PSU! Also they claimed it would lock out the mobile market, and not many hams would recognise the advantages and purchase a 48V 100 W linear rather than a 12V 100 W linear. Of course 48V amateur models have not ever been offered as far as I know and build it yourself articles in the amateur press seem almost non existant. The transistors are there for the aviation/military market. I do believe that there was once a 28V linear kit for 70 CMs made by Communications Concepts.

I think 48V linears could sell and so could 48V Power Supplies. Anyhow 48V supplies are often available surplus as ex-telephone equipment.

I called Dave Andersen again today (April/10/89) and discussed this with him anew. He added, without reference to his notes, that he recalled that high voltage (100V) designs could be more sensitive to high VSWR and of course there was the safety problem with higher voltages. But he did say it was worth looking at again. He has produced high voltage commercial designs in the past, but found they did not sell well. He noted that there are plenty of cheap 28V devices out there that have been used in the

aeronautical radio biz.

Yours

John,

A friend of mine from Georgia brought two boxes of 3 1/2" floppies from Atlanta to New Jersey last fall and all but two of the floppies had been damaged at one of the airports. Someone from Germany sent my Dad a 5 1/4" floppy and it too was damaged, either in the post office or the airport (the disk was properly protected, there was no mechanical damage to the package). While your research has shown that this shouldn't happen, you won't catch *me* going through an airport security device with magnetic media.

Did you remember to remove the write protect stickers from the floppies you tested? ;-)

jim, AD1C

491. ARRL No-Code vs. NIMBY

Newsgroup: rec.ham-radio
Date: 1989-04-11 00:08:33 UTC
From: rc@CMR.ICST.NBS.GOV
Message-ID: <8904110008.AA13257@cmr.icst.nbs.gov>
Source record: 19115

Do I see a bit of NIMBY in the proposed frequency restrictions mentioned in the ARRL No-code Committee report? We are told that the new-class licensees should not be segregated and thus develop their own sub-culture, but should NOT be on two (or Not In My Back Yard).

While I still have VERY mixed feelings about no-code, one thing we all need to do right away is to come up with a different name for the proposed new class. This business of Technician and Technician Plus sounds like cheap Hollywood lack of imagination. (Don't get me wrong, I'm sure the Committee just plain ran out of time when it came to choice of name.)

Some names I WOULDN'T want:
Class Complaint

Talker Lets hope this is NOT descriptive of all the new poeple.
Experimenter Realisticly, the experiment will be opening the Icom box.
Technician Even most present Technicians aren't very technical. Phil Karn aside, I doubt that the new class will be more technical.
Leave the present Technicians with their misnomer.
Numbers "What we need is Numbers; lots of hams."

How about:

Restricted Poor vibes, but less perjorative than Novice, for example.
Development Sounds good; oh, that it would be descriptive.

Any other suggestions? After all, it's the pizzazz, not the merit that sells lots of things these days. (And always has)

Bob W3OTC

Don't blame my employer for these mindless (out-of-hours) rantings.

492. University of California, Davis, Picnic Day

From: u546025938ea@vega.ucdavis.edu
Message-ID: <3928@ucdavis.ucdavis.edu>
Source record: 19116

The University of California at Davis is holding its annual Picnic Day event
on Saturday, April 15, 1989. At this event, the Yolo [County] Amateur Radio
Society will be sponsoring a ham radio display, including demonstrations
to the public of HF, VHF voice, and VHF packet.

Our station operating times are not set, but will most likely be from
10:00 AM to 4:00 PM Pacific Daylight Time (1700 - 2400 hours zulu); however,
these are approximations. Because of the fact that we will be exposed
directly to the public, we would like to have many QSOs. On Saturday, if
you're sitting around your house or shack, turn on your radio. We will most
likely stick to 10 meter sideband (to demonstrate the privileges of entry-level
Novices), but may go to other bands temporarily. Also, the operating will
be mostly voice.

Listen for "CQ from UC Davis Picnic Day" or something to that effect, from a
variety of callsigns.

Hope to hear you on Saturday.

Thanks and 73s,
Steve N6QGG

Providing the radio will accept the duty cycle, you can run RTTY and
Packet simply by placing the rig in Lower-Sideband and running the
transmit audio to the microphone. If you have a speech processor, its
a good idea to keep it *off* to avoid splatter. Most SSB rigs will pass
the 170 hz shift RTTY and 200 hz shift Packet with out a problem. Its
only the seldom-used 850 hz shift that I've had trouble getting through
the filters on most SSB rigs.

495. I built an ultrasonic receiver

Newsgroup: rec.ham-radio
Date: 1989-04-14 20:32:01 UTC
From: parnass@ihuxz.ATT.COM
Message-ID: <4392@ihuxz.ATT.COM>
Source record: 19119
Cross-posted to: rec.ham-radio,sci.electronics,rec.audio

x
I BUILT AN ULTRASONIC RECEIVER

by Bob Parnass, AJ9S

Both midwestern farmers and radio enthusiasts suffered during last summer's record drought. Many of us were plagued with power line interference, as the wooden power poles shrunk without moisture, allowing the power line hardware to become loose and electricity to arc. We could hear the "eggs scrambling" noises throughout the shortwave spectrum, even up through 220 MHz in places.

I spent a few days driving around the neighborhood with an Icom R-7000 VHF/UHF receiver on the front seat trying to pinpoint the offending power line fixtures. I even walked part of the area with a portable scanner, attenuator, and home made loop antenna.

It was a challenge. The fun of the hunt outweighed the annoyance of the interference. Although I was able to locate a few offending transformers, the power company didn't return my call.

Vowing to build another gadget to help pinpoint power line leaks for the next time this happens, I set my sights on building a device to detect the ultrasonic energy emitted by leaky lines. William Nelson's Interference Handbook (Copyright 1981 by Radio Publications, Inc.) shows an old Hewlett Packard ultrasonic detector, useful for finding corona discharge in the 30 kHz to 50 kHz range (pg. 117). Autumn rains came, vanquishing the noise problem and cooling plans for an ultrasonic detector.

Article Revives Interest

A magazine article rekindled interest in ultrasonics. February 1989 Popular Electronics featured a construction article on an ultrasonic receiver. This was a superheterodyne circuit, with a tuneable local oscillator. I decided to build this unit and ordered a kit of parts from Krystal Kits.

The kit consists of the printed circuit board, potentiometers, ICs, resistors, capacitors, PVC pipe and end caps

(used as an enclosure). I bought a 3-3/4" Radio Shack piezo tweeter (40-1382) for use as an ultrasonic microphone, and supplied my own IC sockets, as none were furnished.

This Krystal Kit is nothing like a Heathkit. There are no instructions, just a reprint of the magazine article with a few hand drawn corrections. Mechanical work, like laying out and drilling holes for the enclosure, remains the responsibility of the builder.

The printed circuit board eased construction, but was only of fair quality. There were extra splashes of copper, which required removal with an X-Acto knife. The holes for the mylar capacitors and several resistors were spaced too closely, forcing contorted bending of some component leads.

The oscillator was supposed to tune 15 kHz - 35 kHz, but mine would only tune 12 kHz - 21 kHz using the specified components. I substituted a 2200 ohm resistor for R5 (originally 15K) which expanded the tuning range to 15 kHz - 66 kHz.

Only young listeners can hear pure sounds near or above 20 kHz. Using my ultrasonic receiver, I have listened to sounds I could otherwise not hear from these emitters:

1. televisions
2. older ultrasonic TV remote control transmitter
3. computer terminals
4. video cassette recorder
5. metal detector searchcoil

Sound sources radiate almost equally well in all directions when the wavelength is large compared with the source. At higher frequencies, and smaller wavelengths, the radiation becomes more directional.

Although the receiver is sensitive, there are a few shortcomings: Moderately loud noises in the sonic range can leak through the receiver and be heard. Since the receiver is not shielded, it can detect some electromagnetic fields as well as acoustic signals.

In conventional radio receivers, the local oscillator generates a fairly clean sinusoidal wave. By contrast, the ultrasonic receiver uses a square wave oscillator, which produces strong harmonics. Thus, you can hear harmonics of the same sound at more than one place on the tuning dial.

I am awaiting the arrival of better weather so I can try
listening for power line corona and the ultrasonic sounds
emitted by insects.

496. Computer Control of Keyboard Operated Equipment (Was: Re: Scanners)

It is also simple to interface a keyboard controlled radio receiver (which may lack an RS232C port) to a PC via a parallel port. I have successfully done this with a Sony ICF-2010 portable. This set is nearly totally key-press controlled. Its keyboard circuitry operates on 3 VDC. By employing surface-mount Analog Switches like the 4051, it is possible to construct a circuit which will fit completely within the radio's cabinet that will simulate the individual key-press of a 12 by 12 matrix of keys (the tricky part is the simulation of the simultaneous press of two keys).

Using this circuit technique and a data-base program running on the PC, a program can be written to search the records for stations which match the search criteria in response to a query command, and "print" out a radio key-press command that will cause the selected stations to be tuned.

The receiver has a scanner circuit which will scan those frequencies which have been programmed into its "pre-sets". So, if a station broadcasts on several frequencies, they can be stored to the "pre-sets" and scanned until the best signal quality is found. Of course, it is also possible to write a software scanner.

In short, once you have the radio interfaced to a PC, you can write programs to control it in just about any way you wish. This technique is not only applicable to controlling radios, but virtually any keyboard operated device such as a TV, Micro Wave Oven, X10 System, VCR, Stereo System, or even another computer.

497. ultrasonic mics/transducers

Newsgroup: rec.ham-radio
Date: 1989-04-21 05:19:39 UTC
From: charlie@oakhill.UUCP
Message-ID: <1989@otis.oakhill.UUCP>
Source record: 19121
Cross-posted to: sci.electronics,rec.ham-radio

I am looking for something to use as an ultrsonic microphone.
I have a little 25KHz ultrsonic transducer but it is resonant
at 25KHz and offers a very narrow bandwidth around 25. I'd like
to have something with a broader response. I tested a cheapie
condenser mic and it seems to work at 25K pretty well. The
intended application is a tuneable untrasonic receiver of the
heterodyne/homodyne variety and hence the need for broad-bandedness.
Coverage up to 40KHz is desireable.

498. Easter VHF/UHF/SHF CONFERENCE ANNOUNCEMENT

Newsgroup: rec.ham-radio
Date: 1989-04-21 13:46:14 UTC
From: ewb@raybed2.UUCP
Message-ID: <1303@raybed2.UUCP>
Source record: 19122
Cross-posted to: rec.ham-radio,rec.ham-radio.swap,sci.electronics

The Fifteenth Annual Eastern VHF/UHF/SHF Conference will be held
May 19-21 on the grounds of Rivier College, Nashua New Hampshire. Nashua
is centrally located with easy access via road (RT-3 or RT-93), Bus,
or AIR, (Nashua Airport, or Manchester Airport with connections to New York,
Boston, Chicago, Washington).
Accomodations will be available on the grounds at a rate of $27.50/night
single or $45.00/night double. Morning coffee is included. Many other
accomodations are available ranging from the Red RooF INN to the Sheraton
Terra Hotel. All are within an easy drive. Meals are available locally.
The saturday evening banquet featuring prime rib of beef is available
by reservation only. The cost for the meal is $18.00 p/p.
Conference highlights include the hospitality room starting at 2000 friday
evening, Tech Talks starting sat at 0900 featuring discussions on satellite
receivers, antennas, VHF, UHF, & SHF operation, etc. Also the ever popular
antenna gain contest, for 70, 33, 23, and 13 cm starts saturday at 1100.
Additionally there will be technical exhibits along with some dealers,
photo displays, pre-amp noise figure measuring contest on sunday, as well
as many, many door prizes after the banquet on Saturday evening.
Contact Dave Knight KA1DT 15 Oakdale Ave, Nashua, New Hampshire 03062
for more details or to register. If you have an interest in VHF, UHF, or
SHF operation, this conference is for you.

499. Shuttle Mission STS-30 Details

Newsgroup: rec.ham-radio
Date: 1989-04-22 04:46:15 UTC
From: kd2bd@ka2qhd.UUCP
Message-ID: <852@ka2qhd.UUCP>
Source record: 19123
Cross-posted to: rec.ham-radio,sci.space.shuttle

The U.S. Space Shuttle ATLANTIS is scheduled for launch on mission STS-30 on April 28th at 2:24 PM EDT (1824 UTC). The countdown is scheduled to begin at 8:00 AM (1200 UTC) on Tuesday, April 25th. The lauch window will be 22 minutes in length.

The primary payload of mission STS-30 will be the deployment of the Magellan Venus space probe.

* LAUNCH WINDOWS *

Here are some launch windows assigned for mission STS-30. All times and dates are expressed in UTC:

Date From To
------+-------+------
28Apr : 18:24 : 18:42
29Apr : 18:18 : 18:43
30Apr : 18:13 : 18:44
01May : 18:07 : 18:45
02May : 18:01 : 18:45
03May : 17:54 : 18:46
04May : 17:48 : 18:47

* VENUS FACTS *

Radius: 3,630 miles
Rotational Period: 243 Earth days
Orbit Period: 225 Earth days
Distance from Sun: 64,920,000 miles
Density: 5.2 times that of water
Surface Gravity: 0.907 times that of Earth's gravity
Atmospheric Pressure at Surface: 90 times that of Earth's surface pressure
Surface Temperature: 850 degrees Fahrenheit
Atmospheric Composition: Carbon dioxide (96%); nitrogen (3+%); trace amounts of surface dioxide, water vapor, carbon monoxide, argon, helium, neon, htdrogen chloride and hydrogen fluoride

* MAGELLAN MISSION HIGHLIGHTS *

Interplanetary Cruise: 442 to 468 days
Planned Trajectory Correction Maneuvers: 15 days after deployment from Shuttle; 360 days after deployment from Shuttle; and 17 days before Venus orbit insertion

Orbit Insertion: August 10, 1990, 1700 UTC, STAR 48 solid rocket motor fires
to put spacecraft in orbit around Venus
Mapping Orbit Period: 3.15 hours
Radar Mapping: 37 minutes per orbit
Mapping Orbit Inclination: 86 degrees
Superior Conjuction: October 26 to November 9, 1990
End of Nominal Mission: April 28, 1991
Data Gap Recoverable: June 27 to July 10, 1991

500. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1989-04-23 17:35:04 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <8904250706.AA08399@ucbvax.Berkeley.EDU>
Source record: 18877

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

501. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1989-04-23 17:35:04 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <8904250704.AA08251@ucbvax.Berkeley.EDU>
Source record: 19124

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

502. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1989-04-23 17:35:04 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <8904250703.AA08209@ucbvax.Berkeley.EDU>
Source record: 19125

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

504. Vertical Recommendations

Newsgroup: rec.ham-radio
Date: 1989-04-24 12:00:38 UTC
From: Michael_Edelman%Wayne-MTS@UM.CC.UMICH.EDU
Message-ID: <137432@Wayne-MTS>
Source record: 18878

I'd echo Bob Parnass' caveats about radial-less verticals: It all depends on soil conditions, and even then it's a toss up. I think if John G.'s friend is only interested in 10-15-20 he should consider a Cushcraft R4. It's a bit more expensive (okay, a lot more) than a 12AQV, but friends in this area report excellent results. And it's not really that expensive when you consider it has what amounts to a built in tuner.
73, mike KA8OSZ

505. ATS-803A Shortwave Radio

Newsgroup: rec.ham-radio
Date: 1989-04-24 12:43:43 UTC
From: sterritt%sdevax.decnet@CRDGW1.GE.COM
Message-ID: <8904241243.AA05782@crdgw1.ge.com>
Source record: 18879

Hi,
I got a Radio Shack DX-440 recently, and have since found it to
be *identical* to the ats-803a. It's a very good receiver; I've been able
to get quite a few global stations just using the attached extendo antenna.
I've gotten the $8.49 long-piece-of-wire antenna from RS, but haven't put/hooked
it up yet. The DX-440 is more expensive, but I got a $39.00 5-year total
parts/labor warranty from RS.
NOW: Radio Shack also sells a radio called the DX-360. The book
'Passport to SW Radio' states that not only is it terribly difficult to
tune accurately, AND that it doesn't get the whole 150-29,999 kHz band,
BUT its reception and sound quality are terrible. Alas, it's only $79.99,
so lots of people buy it and think that world radio is horrible because
it is horrible.
So, if you must save the $$$, buy the ats-803a from CSN. It comes
with headphones that the RS doesn't. If you want local service (my first
had a 'bug' that caused it to hum quietly, but annoyingly, when the power
was off) get the RS-label.
--chris sterritt
sterritt%sdevax.decnet@crd.ge.com
Oh, and once you get it, buy BOTH the 'World Radio and TV Handbook' and the
'Passport to SW Radio'. They have the same information, but organize it
differently, so some stuff you grab one, other info you grab the other.
Haven't checked into the magazines yet, but have gotten one recommendation
that said, basically, that 'Popular Communications' is pretty bogus, and
'Monitoring Times' is very good.
Both will send you an example issue for few $. See Passport or WRTH ads.

508. BATRADIO

Newsgroup: rec.ham-radio
Date: 1989-04-24 15:25:04 UTC
From: charlie@oakhill.UUCP
Message-ID: <2000@radio.oakhill.UUCP>
Source record: 18882
Cross-posted to: rec.ham-radio,sci.electronics

This weekend I decided to scrounge through my junkbox and build
a BATRADIO. I took a 25 Khz narrowband ultrasonic transducer
and preamp'd it and passed the amplified signal to a homebrew
direct conversion 25 KHz receiver. The receiver was a homebrew
mixer and a Wavetek 111B (B as in battery powered). The output
of the mixer was lowpass filtered and sent a jambox for listening.

Austin has a rather unique downtown bat population that lives under
the Congress street bridge. At sundown the bats begin stirring and
then, all at once, about 500,000 bats stop hanging around and start
flying in one giant cloud. Bazzare. The BATRADIO worked great and
I learned a lot about bat transmissions.

Later, after the bats had left the bridge, I drove home and set up
the BATRADIO again. I detected one lone bat, somewhere in the dark
chirping away.

Bat transmissions are FM/AM. That is, they are swept pulses, like
a chirp...which is what they sound like when you downconvert to
the 'human band'. Sometimes the chirping is fast ... sometimes slow.
The bat on my street was chirping slowly until a car drove by and
it suddenly went to double the chip rate...presumably it had
'locked on' to the car. When the car went away the bat resumed
chirping at the slower rate. From what I could tell the bats
must have a 'deviation' of 5 to 10 KHz. Since my receiver was
only about 2 KHz wide at 25 KHz I couldn't know exactly what the
deviation was. The transducer that I used was resonant so it was
not very useful to tune my local oscillator since the sensitivity
dropped off abruptly outside the range of the transducer's center
frequency.

Anyway, it was an educational experience... and the best VLF'ing
I've done in a long time! Happy bat hunting.

I have the older Cushcraft 1/2 wave vertical. Mine has the motor drive matching unit which is cumbersome. However, the antenna really performs well. I have used it both at home and in the field with the Scouts with great performance. Since it is a half-wave, it does not need a ground plane. I have tried 1/4 wave verticals with/without ground planes and never got acceptable performance.

I drove a 6 foot pole completely in the ground. Then I put a 18 foot pole inside the first pole. The antenna is mounted to the top of the pole. I have not needed guys, and the thing has stayed up for approx 5 years with some winds in the 60 mph range. I wanted the antenna up since there are kids who play in the back yard on occasion and I didn't want any nasty surprizes.

The Cushcraft is outrageously expensive, but it was the only antenna which worked in my situation. The low angle of radiation (theoretically 0) lets me work almost everything I can hear with only 100 watts. -- Doug WA6VVV

I have a cushcraft R4 and it is pretty good. Not a world class DX
antenna, but works fine. They just came out with a R5 which covers
20/17/15/12/10. Mine covers all but 17, but there is an upgrade availiable
You can gound mount the antenna, but it does not have to be ground mounted.
I have mine up abut 15 on a TV antenna mast mounted to the side of the
house. Actually the antenna is a half wave antenna, and that is
why no radials are needed. The matching network matches the high impedance
feed to the 50 ohm cable. I have an SWR of under 2:1 across all bands.
Since your friend is not trying to get on 80/40 with the vertical, I would
highly recommend the R4/R5. Also there is a review by W1ICP in the April
CQ on the R4. He gave the antenna high marks also.

>conflict within the amateur ranks because of repeater wars. Do you
>really want that? No benefit is enough to put up with repeater wars.
>
Repeater wars were disastrous to those who didn't expect them, or
who didn't know how to cope with them. Malicious interference was
part of some such wars, and should not be condoned. That's different
from the "wars" that go on constantly on the DC bands, where QRM is
simply expected.

>>I don't want coordinators to order anyone offf the air. Repeaters
>>can share frequencies. Voice machines can use PL, anti-PL, bursts,

>will interfere with each other will do nothing more than start,
>officially, a repeater war. That is no more practical than simply
>ordering them off the air.
>Besides, there's that word "priority" again. We can't establish
>priorities.
>Your plan is not politically possible.

Co-channeling repeaters where they are warned that they have some
overlapping coverage is not the same as putting two open repeaters
five miles apart on the same pair. Commercial users have gone
to PL, anti-PL, etc.; these techniques work, especially when the
primary coverage areas differ but secondary areas overlap.

Even a binary priority is a priority. Guy On The Air has priority over
Guy Not On The Air. I see it as quite politically possible to change
this, though the Guys On THe Air (once every month) won't like it.

>The marketplace may do it, but it will do it within the bounds of
>frequency coordination.

If I were to go to my local coordinator and say I wanted a packet repeater-pair, and he followed your rules (I don't know whose he follows, so this is a hypo), then he'll say, "fine, get on the waiting list." I'll no doubt have my channel by April 1, 2007. That's not a marketplace issue -- lots of semi-idle repeaters still take up frequencies.

Again this may stem from experiences -- mine in NYC differ from yours in TX. (It's more peaceful in NE where I live now.) A few repeater overlaps were annoying, but owners worked things out in various ways. So long as everyone knew that they had no God-given right to total exclusivity, and didn't cause MALICIOUS interference, things worked. I have heard some obnoxious californians who obviously needed more uh pursuasion.

Still, coordinators have more options than to simply make waiting lines and leave all intact allocations totally free of sharing.

Date: 1989-04-24 18:43:15 UTC
From: wordy@cup.portal.com
Message-ID: <17556@cup.portal.com>
Source record: 18890

Be careful with installation of on-glass antennas on cars that have
been through car washes... there are waxy cleaners that render the glass
impervious to anything sticky.

There is a product called RAIN-X that allows rain to fall off the glass
by filling in the micropores, and an adhesive antenna will slide right
off. The recommended fix is to scrub the glass with a mild abrasive
after first cleaning with Windex to remove loose particles. Follow this
with the alcohol wipes that come with the antenna.
Finally, heat the glass with a hair dryer to drive out moisture,
then immediately install the antenna. 70-90 degrees F is adequate.

Cheers & 73...

While it is true that an AM stereo radio was possible which would receive any of the competing AM stereo systems, my understanding is that such receivers would have cost at least $200 (I can check the NTIA report--one of them--to se for sure). Since the general public (especially audiophiles) are not into AM radio anyway, how realistic would it be for them to spend that amount of money for an AM radio?

The FCC's decision *not* to set a standard set up the classic chicken-and-egg scenario: radio stations were reluctant to install a system that might be made obsolete and receiver manufacturers were unwilling to market AM stereo receivers until there were some "critical mass" of AM stereo stations operating.

I don't know how it can be argued that AM stereo wouldn't make a difference. We just don't know. Too few people ever 1) had access to AM stereo in their markets and 2) had a receiver that would pick up the appropriate signal.

From: Michael_Edelman%Wayne-MTS@UM.CC.UMICH.EDU
Message-ID: <137790@Wayne-MTS>
Source record: 18897

The March 1989 issue of Electronics and Wireless World has an
interesting article on a new class of physically small transmitting
antennas whose physical size is unrelated to the wavelength of
the operating frequency. The antennas, called crossed-field antennas,
are reported to have excellent radiation efficiency, wide bandwidth
and excellent recieving qualities, and according to the authors,
there appears to be no restriction in physical size- they can be made
as small as possible.

The design appears to take advantage of the displacement current as
a significant source of magnetic field surrounding capacitor plates
at high freqencies. Now, I'm neither engineer nor physicist; I'm a
displaced psycholinguist in the computer biz. It follows that the equations
in the article are beyond my skill to examine. Still, it looks exciting.
I'd like to experiment with the concept. Has anyone else seen this article?

Speaking of AM..I have a question for you commercial broadcast guys:

Isn't it true that the 'funkiness' of AM comes from the narrow receiver I.F. passband? Because of narrow AM channel spacing? Isn't it also true that the AM stations do not roll off their audio as sharply as the receiver leads you to believe? IF this is TRUE then has anybody tried driving up to their favorite AM station and using a broad band crystal detector into a high quality audio/speaker system to see what AM COULD sound like if someone made a variable I.F. bandwidth receiver? The variable I.F. bandwidth would be useful for adjacent channel rejection. When there is not adjacent channel (usually during the day and in non-megopolis cities) interference the user could crank up the I.F. bandwidth and suck in more of the distant sidebands from the carrier frequency thus retreiving the otherwise lost high frequencies. I know this sounds expensive but in mass production probably not.

I've always noticed that if you 'tune off to the side' of center frequency while listening to an AM station that you can hear the cymbals and syllabants in the program audio (at the expense of distortion) thus proving that there is more info being broacast that is being received.

So what say Dataspan man?

Hmmm... how about one of those cheap electret pellet microphones?
These are the kind that are built into small cassette tape recorders
and hand-picked ones are used as the element in a PZM. They are
normally bandwidth-limited by the circuit they are used in, but I
think they will actually respond well into the ultrasonic range.

I am not sure if one of the old power 12V power cords for a 2AT uses
this method but it seems likely that connecting a number of 2.5A rectifier
diodes in series to drop the voltage from a 12v battery by .7 volts at a
time would work. My 2AT runs on voltages between 7.2v and 10.8v and it ln
should work nicely on 10.6v off of a car battery with 3 diodes, though I plan
to drop the voltage more than that. In addition, I plan to put in an inductor,
cap, fuse, reverse biased diode for reverse polarity protection, and maybe
even a crowbar circuit just in case the voltage goes too high.
Does anyone have any comments on this method?

And we are told ad nauseum by the keep code dinausors, one of the
reasons we need to keep CW is to exclude the riff-raff from amateur radio. I
keep saying listen to 20 M any day or 80 M any evening. This comment of mine
is usually ignored. Seems the WARC professionals have not ignored it. Seems
to me that CW has not excluded the riff-raff, but who will admit it?

And then the pros listen to Amateur VHF/UHF bands and hear silence (all
assigened of course) and they say: "Why should we give up frequencies for
this?"

It is interesting to watch the academic discussion of Stereo going on here. The posters and readers are all techies/nerds and understand such matters. What does the public understand? Not much alas, they hear buzz words, are told they are good and want them. This is why they buy telephones called "Turbo" and cars called "Laser".

In the early sventies the BBC (Beeb) did a street survey of the common public re their radio reception. One of the questions was: "Which programmes do you receive in stereo?" In there was a "ringer" a programme that was only transmitted on AM (No FM stereo available). Something like 45% of the public were receiving this programme in stereo!

How many of you have seen stereo speakers in non stereo positions: Both behind the sofa - out of the way. One on top of the other. Both lying on their backs on top of a wardrobe (armoire). Stereo is good, we have a stereo. Do not discuss imaging with these people, they don't care. They want stereo and interior decoration.

My opinion of AM stereo is that it is a marketing programme. A way to sell AM to the hoi-polloi. Boy are people going to wail about this. Sure the public want AM stereo, they want anything "New and Improved". Have you asked anyone non technical about digital tape (DAT)? Ask around, most seem to be of the opinion that it is an improved tape formulation for their compact cassette recorder. The majority of the public do not know what the word digital means, but it is good and they want it. CD players in Ghetto blasters is a waste, but it is new, has all the right buzz words and they want it.

Of course price comes above performance, I think the Beta VHS tape war proved that. Crummy pictures for less per hour won the battle.

There is, in this town, a "Talk Format" AM station that broadcasts "In Stereo". Yup, stereo is good and they want it.

This may appear snide and arrogant, it is not meant to be, I am trying to point out that we should talk to the public. Their perception of technology is different from ours - very different.

One last sarcastic comment with a hint of truth: "If my CB has an antenna on each side of the truck, does it mean I am transmitting in stereo?"

Oh, yes, the quality of AM audio could be much better, so could the quality of FM stations. But advertisers judge a station by the size of the audience, not frequency response and dynamic range. This may account for the fact that the best sounding stations in LA are the non commercial stations. I have been told by station engineers here that you gotta make it loud. Yes,

I have been shown how to put tape on the turntable idler to speed it up -
make the music sound jazzier.

> --phil ka9wgn--

Thanks Phil, I think you got the original intent of my posting. While I
do not condone my friend's illegal radio operation (believe me, I am VERY
vocal about my displeasure) I know that he WANTS to be legal and that
he is interested in following the rules.

It was perhaps imprudent of me to argue my point by citing an example
of someone operating illegally.

My friend is an innovative and gifted "hacker" in electronics, communications,
and radio. While I can't condone breaking the law, I acknowledge that it is
typical of such people to bend and break rules in the course of their hacking.

I find his spirit inspirational, even as I chide him for operating illegally.

536. Sony problem

Newsgroup: rec.ham-radio
Date: 1989-04-25 20:25:20 UTC
From: geoffre@oravax.UUCP
Message-ID: <858@oravax.UUCP>
Source record: 18906

I sent my Sony ICF 2010 back to Sony (it was still under warranty) and it came back last friday with exactly the same problem. Now I'm dreading a protracted hassle as I try to get it fixed again (the warranty expired while it was being repaired, and though it's still covered for that fault it could cause problems). So I thought I'd see whether anyone else has had the same problem, as I could do with some amunition when I send it back.

The synchronous detection circuitry stopped working, and then the usb and lsb went out in sympathy. If I press <sync>, the signal-strength lights remain on, but there is no sound, and neither of the upper or lower indicators lights up. The situation with usb and lsb is similar. Oddly, if I rotate the manual tuning knob there is an instant of sound as the frequency makes its incremental jump. If I rotate the tuning knob back and forth like a madman, I can actually hear, but this is hardly the ideal of relaxing, listening to the ether, after a long hard day's work. Occasionally, the problem disappeared for a minute, when it was first turned on (it wasn't the batteries).

The invoice from Sony used cryptic abbreviations, and mentioned cleaning and electrical adjustment.

I'd appreciate hearing from anyone who could shed some light on this.

From: phil@ux1.cso.uiuc.edu
Message-ID: <30500026@ux1.cso.uiuc.edu>
Source record: 18907

It has been said that CW can get you through when other modes can't, when propogation is poor and/or noise is high. I agree. The reason CW can do this is because IT IS *NOT* EFFICIENT. It is REDUNDANT. You leave a carrier on for many milliseconds that's doing nothing at all but being there.

Of course the slower you send, the more redundant you are, and the more likely you are to get through the really bad noise. This is what is often done on very weak EME paths. They sometimes send so slow it is excruciating to just send a call sign.

So if we are going say that "because CW is (for reasons of inefficiency and redundancy) able to get through QSB/QRN/QRM better, we must make everyone learn how to do it" then we might as well lower the code speed requirement to 1 WPM for all license classes, as that is THE speed to get through with. And while we are at it, why not let people use a Morse Code chart during the test, since at 1 WPM, that's all they need anyway.

> is TRUE then has anybody tried driving up to their favorite AM
> station and using a broad band crystal detector into a high
> quality audio/speaker system to see what AM COULD sound like

Yes, I've done all the above. The AM station modulation
monitor, BTW, is a wideband crystal detector (generally) and
dumps everything to the air monitor. Most station owners hear
this and think their stations sound just dandy!

If anything, AM needs its bandwidth limited. I'm
a proponent of NRSC-1, the "audio mask" which limits AM
audio to 10 kc (occupied channel to 20 kc). This is far
in excess of conventional AM radios. While 10 kc is not
hi-fi, it compares well with overprocessed FM stations.
Another benefit of NRSC-1 is the specification of
75 uS preemphasis, which helps brighten up standard
radios, while providing noise reduction to NRSC
compliant sets - which are frequently appearing in new
cars.

I installed the brickwall filter, and the
preempahsis (about $700) at all my client stations.
If you put the brickwall filter (down -40 dB at 11 kc)
in your home tape monitor loop, the loss in highs is
obvious. In a noisy car, who cares? The reduction
in high frequency distortion and splatter is amazing;
and NRSC compliant receivers sound great. Besides,
I don't have to transmit anything above 10 kc anymore,
which saves me $75-$175 mo in power at my 50 kw
stations (no joke, I have the Detroit Edison bills
to prove it over a year).

Many AM stations don't limit the audio at all;
the practical upper limit is sometimes the transmitter
(say, 10 kc for 1940's equipment), sometimes, the
antenna system has very high "Q", and directionals are
troublesome where the phasing and coupling equipment
was designed for CW. However, even the worst directional
I know of (WBIV Natick, MA) sounds so overwhelmingly
better on an NRSC compliant receiver that you will

gladly give up the 10-20 kHz segment.

In short, AM stations have been capable of program quality audio since roughly 1955 (decent xmitters), being quite capable of delivering to the receiving antenna audio that (until recently) was superior to your local TV station. (Flames down, boys, old optical prints of Mary Tyler Moore and 5 kc network loops are not even lo-fi). The public perception of "terrible" AM lies squarely at the feet of the installed receiver base.

The public hate of AM is deeply ingrained. About half the people I show the "narrow-wide" switch say "wide" sounds "tinny." Yet, flipping over to FM, it sounds "okay.". The other half say "that's neat, but there is nothing worth listening to on AM..."

What do people in 9 kc spaced countries do, or do SWL's ?

Food for thought....

In article <7120060@hpcupt1.HP.COM> bmp@hpcupt1.HP.COM (Brian M. Perkin) writes:

>As I was doing the cross-band repeater mod (you
>might consider it a simplex range extender) it seems
>that there are several other 0 ohm surface mount
>resistors (shorts) grounding several other pins
>on the microprocessor. Does anyone know what other
>undocumented features these units have?

The programming resistors do the following:

1. Select the European frequency bands (430 - 440)
2. Select MARS/CAP xmit freqs (141 - 150)
3. Select unrestricted out-of-band xmit (add a jumper)
4. Select cross-band repeater mod
5. Disable built-in 3 minute timeout timer for crossband repeater.

Number 1 was easy, I just installed a jumper where there were a pair
of empty pads next to a row of four or five other 0 ohm (jumper) "resistors".
I found this quite useless and promptly removed it.

Number 2 is also very easy, but unnessary for 90% of us. If you need MARS/CAP
then you'll be able to get the details from Kenwood.

Number 3 is somewhat of a mystery as I've been told the jumper position
but have been unable to find it on the board. My interest was in
opening up the UHF receive to hear the public service channels.
Unfortuneatly, this mod opens up transmit as well, on both bands and
apparently without restriction (as the gossip goes).

Number 4 is real easy and involves removing the resistor marked R121 on the
schematic.

Number 5 is also easy and just remove R122 to do it. (I haven't though)

What I'd like to know concerns the remote control capabilities that are
available through the microphone plug. From looking at the manual,
it's clear that when the RC-10 remote control handset is used, many of
the radio's front panel controls are made remotely available. Does
anybody know the manner in which the three data pins on the mike plug
are used for this. The three pins are PTT, UP and DOWN (in normal
mode). Presumably, there is a way to communicate with the onboard
microprocessor using these pins. If so, then somebody could
concievably use their PC to control the radio.

Inquiring minds want to know....

Any Ideas?

540. Re: Vertical Recommendations

Newsgroup: rec.ham-radio
Date: 1989-04-25 22:19:35 UTC
From: rkarlqu@hpscdc.HP.COM
Message-ID: <5490051@hpscdc.HP.COM>
Source record: 18911

Question on the Cush-Craft R4 vertical:

It is advertised as a "half-wave" vertical, but I
recently learned that it is in fact 18 feet high, which
is barely a quarter wave on the lowest band (14 MHz.).
Evidently, the trap(s) are intended to make it look
1/2 wave long electrically. It is not clear to me that
doing this electrical slight-of-hand results in a large
driving point impedance at the bottom, such as a true
1/2 wave vertical has. It seems to me the current distribution
would be a hybrid of differential and common mode.
Differential mode means the top and bottom are out of
phase and the center has zero voltage. Common mode
means the entire 18 feet is of the same phase (although
the amplitude tapers off). The common mode energy would
cause ground currents to flow down the outside of the
coax, there being little or nothing in the way of a
counterpoise to stop them.

Can anyone explain this better? Any R4 owners who could
post detailed info on the location and electrical parameters
of the traps? Also, by analyzing the matching network, it
should be possible to determine the driving point impedance
of the antenna on 14 MHz. If this is only a few hundred
ohms, instead of the few thousand ohms of a true Zepp, it
would tend to confirm my suspicions.

All this is not intended to be derogatory of the R4. I
used a 33 foot vertical on 14 Mhz. for years and swear
by it. (The R4 wasn't on the market then).

Since you asked, Patty, W5EHM (Univ. of Texas ARC), came top in the South Texas section of the CW Sweepstakes - with three club members operating, one of them being my Good Self.

Never mind that we got beaten by some of the single-op stations, nor that there were only two entrants in our division :-) :-)

Our club also won STX on phone, against much stiffer competition (two other entrants rather than just one), but I can't take any credit for this one. It took 7 ops to do this, but they still got beaten by a couple of single-ops.

Funny things, contests.

>on the repeater I hear people say things like "want to go to five-two?".
>Sad, sad, sad.
>
>--phil ka9wgn--

Phil, as a previous poster pointed out, channel 9 of CB land is often worthless for emergencies simply because it is a boring place. True, there are dedicated REACT people here and there and in this state the state police monitor 9, but they also monitor 17 and 19 where the action is on the interstate. Now if we made 146.52 a channel 9 type frequency then it would be a boring place also and I for one would not listen to it. Since there is lots of simplex activity in this area, 146.52 is popular and that at least guarantees someone will be listening.
As for your subscribing to the "calling frequency" attitude that I presume comes from Newington, I give you the example of the Portland, Oregon 146.34/94 repeater which has a 30 second timeout and rag chewing is actively discouraged. Its been that way for more than 10 years and its also been a DEAD CHANNEL for 10 years. Whats sad is to hear someone from out of town trying to raise somebody on what is usually the most popular frequency in other places.
What are you going to do, make 29.600 a quiet zone? How about 144.200? The very act of moving off channel to some unknown frequency discourages multi-person QSO's and isolates the ham community causing cliquishness.

A born ragchewer,

The ARRL Letter, Volume 8, Number 8, April 21, 1989

Published by: The American Radio Relay League, Inc. 225 Main St.
Newington, CT 06111

Editor: Jay Mabey, NU0X

Material from The ARRL Letter may be reproduced in whole or in part, in any form, including photoreproduction and electronic databanks, provided that credit is given to The ARRL Letter and to the American Radio Relay League, Inc.

PART 15 LOW POWER DEVICE RULES ADOPTED--INCLUDES 4 HAM BANDS!

On March 30, the FCC adopted its First Report and Order in General Docket 87-389, amending Part 15 of its rules governing radio- frequency devices, which, because of their low power, are not required to be licensed.

The Order was released April 18, too late to be used in this issue of the ARRL Letter. The information here is drawn from the official presentation at the FCC open meeting, the press conference which followed and from ARRL Washington Coordinator Perry Williams, W1UED.

There's good news, bad news and ghastly news. The good news is that the leakage permitted from some non intentional radiating devices (a broad class of devices including radio and TV receivers, VCRs, stereo equipment and the like) will have to be reduced to the more stringent limits now permitted to Class B computing devices which are used in the home.

The bad news is that non compliant devices of this type are "grandfathered" for ten years! Existing TV tuners, for instance, can be designed, built and sold for another decade, having to observe only today's radiation limits. Though the FCC didn't say a word about RFI to consumer devices, the improvements eventually made in front ends of TVs and VCR/TV combinations should result in improved RF rejection, and thus less likelihood of RFI complaints, but we'll have to wait until the next century to know!

The ghastly news is that the FCC has adopted seven new "consumer bands" where intentional radiating devices, such as home security systems, garage-door openers, wireless stereo speakers and TV "wireless rabbits" (devices which transfer programs to other TVs and VCRs throughout the

house) may operate with higher power than otherwise would be permitted. Four of the specified bands, supposedly selected because Industrial, Scientific and Medical (ISM) devices already operate there, are allocated to the Amateur Radio Service on a primary or secondary basis.

These bands are: 902-920 MHz, 2400-2483.5 (the amateur band here is 2390-2450 MHz), 5725-5875 MHz (hams have 5650-5925 MHz) and 24.00-24.25 GHz (of which 24.00-24.05 is exclusively amateur, the remainder shared).

Existing intentional radiating devices which do not comply with the new technical limits are grandfathered for three years in the design phase, five years for importing and marketing. The new devices, including "TV rabbits" and remote speakers, must comply with the standards set out in the Order from the start.

Questioning of the FCC staff by ARRL revealed that the Order does not deal with RFI issues at all. Manufacturers are not required to include instructions on dealing with interference in consumer guides furnished with their equipment. The only gesture the FCC made toward warning the public about interference is a label stating that the device must not cause interference to any licensed radio service and must accept interference which occurs to it from such services. The second part of this label is not required on radio and TV receivers. Two days after the FCC Order was adopted, the ARRL Executive Committee voted to seek reconsideration and whatever injunctive relief is necessary to protect amateur interests.

1989 DARA AWARD WINNERS NAMED

The Dayton Amateur Radio Association (DARA) HamVention Awards Committee has named Bill Pasternak, WA6ITF, as its 1989 Radio Amateur of the Year. Pasternak was chosen, according to HamVention General Chairman Bill McNabb, WD8SAY, based on "his continuing interest in the promotion of Amateur Radio, his direct participation in the Westlink Amateur Radio News Service, as the author of Amateur Radio articles and books and as the producer of Amateur Radio related videos including The New World of Amateur Radio..."

Chosen as the winner of the Technical Excellence Award is Byron Goodman, W1DX. Goodman was honored for his involvement in the early days of the development of Amateur Radio single-sideband communications and for his founding of the ARRL DXCC program.

The 1989 Specific Achievement Award goes to Phil Karn, KA9Q, (see ARRL Letter Vol. 8 No. 7, page 3) for his work in the development of packet-radio software and his numerous writings on the use of computers in Amateur Radio. Karn was also recognized for his ongoing technical volunteer work with AMSAT-NA.

Presentation of awards will be made at the annual DARA Awards Banquet that will take place on Saturday evening, April 29. 1984 Radio Amateur of the Year Dave Bell, W6AQ, is scheduled to be the keynote speaker.

CRRL RESPONDS TO DOC DEREGULATION PROPOSAL

The Canadian Radio Relay League (CRRL) has responded to the DOC's deregulation proposal. In its submission, CRRL indicated that the deregulation would meet many present and future needs of the Canadian Amateur Service.

CRRL However, expressed the following concerns as well: First; the proposal specified a 6-kHz maximum bandwidth for the 10.100 - 10.150 MHz band. This would allow SSB operation which could interfere with fixed stations that are primary users of this band. Such interference could cause amateurs to lose the band worldwide. CRRL asked DOC to specify a maximum bandwidth of 1 kHz.

A second CRRL concern was DOC's proposal allowing an amateur to establish a home, portable and mobile station under one call, but not to operate these concurrently. CRRL asked DOC to permit this again so amateurs operating computer-controlled BBSs while, say, operating mobile, would not have to get a second station license and call.

Thirdly, CRRL asked DOC to continue issuing VE0 calls for stations on ships in international waters.

The final concern voiced by CRRL noted that deregulation, specifically deregulation of mode subbands, could upset the equilibrium between the Canadian and US Amateur Radio communities. If Canadian amateurs came to understand that, under deregulation, they were free to operate any mode on any frequency in the amateur bands -- without regard for the international Amateur Radio community -- there could be reaction in the US which would result in expansion of US phone subbands. CRRL asked DOC to emphasize to amateurs the importance of observing voluntary band plans developed by the International Amateur Radio Union (IARU).

FCC-ISSUED CALL SIGN UPDATE

W1AW OPEN HOUSE SCHEDULED

Open house! The ARRL HQ building will be open Sunday, June 11, from 10 AM to 4 PM. If your club or group wants to schedule a visit, please notify Membership Communications Services at HQ. Be sure to bring a copy of your license if you'd like to operate W1AW, however, operating time may be severely limited due to construction.

The Newington Amateur Radio League (NARL) is sponsoring their annual hamfest and flea-market the same day as the W1AW open house. The festivities will be held at the Newington High School between the hours of 9 AM and 2 PM, with "guide service" to HQ provided.

HF PACKET RADIO COOPERATIVE DESIGN INITIATIVE

The ARRL has announced the creation of a new project to develop the next generation of modems and protocols for HF packet radio transmission. The project will coordinate the efforts of Amateur Radio designers whose proposals are adopted by the ARRL. Modest funding will be available for reimbursement of approved direct out-of-pocket expenses relating to the development of prototypes, but not labor, overhead or other costs.

Overall funding for this project is to come from two sources. One is from the ARRL Technology Fund, which welcomes individual and corporate contributions. Also, the League has applied to the Federal Emergency Management Agency (FEMA) for a small grant to help underwrite this project.

Serious designers interested in participating in this development project may obtain further information from Lori Weinberg at ARRL HQ. General information concerning this project may be found in the May issue of QST on pages 54-55.

FCC INSPECTOR GENERAL NAMED

The Commission has named John Kamp, currently Director of Public Affairs, as the FCC's first Inspector General.

The newly created office of Inspector General is one of 33 such offices created by the Inspector General Amendment Act of 1988.

Kamp's responsibilities will include the conduct and supervision of audits and investigations relating to the programs and operations of the agency; recommending policies for activities designed to promote economy, efficiency and effectiveness, as well as to prevent and detect fraud and abuse in agency programs; and to keep Congress fully informed about any problems or deficiencies within the agency.

Kamp joined the Commission in 1980 as a staff attorney in the Policy and Rules Division, and since has held several legal, policy and public liaison positions throughout the agency. Kamp has also served on the personal staffs of Commissioner James Quello, former Chairman Mark Fowler, and former Mass Media Chief James McKinney.

BBC IS OFF 17 METERS!

There is good news for 17 meter fans! The BBC has vacated its 18.080 MHz broadcasting frequency when it shifted to the spring schedule. Their new frequency is 17.640 MHz.

David Evans, G3OUF, of the Radio Society of Great Britain (RSGB) contacted BBC at the ARRL's request and reports that the move is intended to be permanent.

ARRL MEMBERSHIP FIGURES ARE UP

Once again ARRL membership figures have increased over last year's totals:

Division 1988 1989 to date

Atlantic 15,276 15,822
Central 11,671 12,149
Dakota 3,163 3,341
Delta 5,869 6,227
Great Lakes 12,918 13,539
Hudson 9,713 9,938
Midwest 6,930 7,123
New England 10,899 11,395
Northwestern 8,229 8,909
Pacific 9,671 10,187
Roanoke 9,618 10,142
Rocky Mountain 4,357 4,596
Southeastern 13,862 14,515
Southwestern 13,463 14,154
West Gulf 10,069 10,515

Total membership figures show 158,448 this year compared to 151,361 at this time last year!

DOVE MICROSAT SCHEDULED FOR LAUNCH

The Digital Orbiting Voice Encoder (DOVE) MicroSat will be launched from French Guyana in Fall 1989 by the European Space Agency (ESA) aboard an Ariane 4 launch vehicle.

DOVE is sponsored by AMSAT's Brazilian counterpart, BRAMSAT, and its sun-synchronous orbit will allow ground stations to hear two morning passes, transmitting on 145.970 MHz. DOVE will begin an Amateur Radio educational project that will last one year and include short messages expressing school student's wishes for peace in the world to be transmitted via DOVE's voice encoder. For further details contact

Rich Ensign, N8IWJ,
421 N. Military,
Dearborn, MI 48124,
313-274-1718 (home)
313-278-0900 (school).

RSGB CALL FOR PAPERS

Anyone interested in presenting a paper at the second Radio Society of Great Britain (RSGB) Data Symposium should contact Mike Dennison, G3XDV, at RSGB HQ as soon as possible.

The Symposium is to be held concurrently with the AMSAT-UK Space Colloquium on July 28-30.

Further information may be obtained by writing C/O Lambda House, Cranborne Road, Potters Bar, Hertsfordshire, EN6 3JE, England.

FIRST TEN 17-METER 'WAS' AWARDS Congratulations are in order to the first ten amateurs to earn Worked All States (WAS) on the 17-meter band. The award winners are:

1) Christopher M. Merchant, KA1LMR
2) Joseph Reisert, Jr., W1JR
3) Steven R. Buerg, KD6PY
4) Charles A. Brown, N5CB
5) Walter T. Qualls, W5ERG
6) Raymond C. Baldwin, WB7OHF
7) Theodore H. Raschick, W0RGT
8) Richard I. Little, KY9L
9) Carl D. Hagler, K5CKQ
10)Thomas O. Thorburn, KA1POP

PHIL SAGER, WB4FDT, LEAVES HQ

Phil Sager, WB4FDT, who has conducted the Happenings and League Lines columns in QST for over 3 years, is leaving HQ to attend graduate school at Louisiana Tech University in Ruston, Louisiana.

Phil was also ARRL Letter Editor in 1986-87, and has been in charge of keeping The FCC Rulebook up-to-date since coming to HQ in 1986. During the mid-1970's, Phil worked in the former Amateur and Citizens Division of the FCC in Washington, DC -- the only League staffer to work at the FCC in that capacity -- and served as Virginia Section Manager from 1982-84. Good luck Phil!

ARRL DX NR 16 (ARLD016) 4/21/89

THANKS TO W9NUF AND THE NORTHERN ILLINOIS DX ASSOCIATION FOR THE FOLLOWING DX INFORMATION.

CONWAY REEF/FIJI. 3D2CR IS CURRENTLY ACTIVE ON SSB AND CW. THEY HAVE APPLIED TO DXAC FOR SEPARATE COUNTRY STATUS. QSLS FOR SSB QSOS GO TO DL9KX, WHILE CW QSLS GO VIA DJ9ON.

CRETE. N6DX PLANS TO OPERATE PORTABLE SV9 FROM APRIL 28 TO 31.

MARION ISLAND. ZS8MI IS ON THE ISLAND AND HAS BEEN WORKED BY EUROPEANS. HE PLANS TO BECOME MORE ACTIVE IN A MONTH OR SO, USING A NORTH POINTING RHOMBIC ANTENNA.

MOZAMBIQUE. THE LICE*zC9MKT EXPIRES IN JUNE. HE PLANS TO BE ACTIVE MAY 12 TO 14 AND MAY 19 TO 21. QSL VIA SM5DKM.

NEW CALEDONIA. NORMAN, YJ8JS PLANS TO ACTIVATE BANKS ISLAND FROM MAY 8 TO 12. THEN HE WILL BE ON FROM TORRES ISLAND MAY 14 TO 18. QSL VIA N4EVS.

OCEAN ISLAND JIM SMITH, VK9NS AND BOB, KN6J WILL ACTIVATE OCEAN ISLAND IN THE KIRIBAT REPUBLIC FOR TWO WEEKS STARTING ABOUT APRIL 30. THEY HAVE APPLIED TO DXAC FOR SEPARATE COUNTRY STATUS.

PITCAIRN ISLAND. VR6ID HAS BEEN WORKED ON 14240 KHZ AT 0330Z AND VR6KY ON 28334 KHZ AT 2230Z. QSL TO CALLBOOK ADDRESS.

REVILLA GIGEDO. THE XF4L OPERATION ENDED ON WEDNESDAY QSLS GO VIA OH2BN.

ST PETER AND PAULS ROCKS. A THREE MAN OPERATION USING THE CALLSIGNS ZY0SS, ZY0SW AND ZY0SY WILL BE ACTIVE ON ALL MODES INCLUDING RTTY FROM MAY 7 TO 10.

SOMALIA. I2JSB RETURNS TO SOMALIA SOON. HE MAY USE THE CALLSIGN T53SJ OR T50DX.

SVALBARD. KIRSTI, VK9NL AND LAILA, WA4ZEL WILL OPERATE PORTABLE JW BEGINNING JUNE 3.

WALLIS ISLAND. FW0BX CONTINUES TO BE VERY ACTIVE. QSL TO RON AT HIS HOME CALLSIGN, ZL1AMO.

WESTERN CAROLINE ISLANDS. TORU, JG1RVN/AH2CE WILL MAINLY RTTY FROM
THE WESTERN CAROLINES MAY 23 TO 26.

In this issue:
- Wrap-up on ARRL No-Code Panel Report
- New Part 15 Rules Issued!

HamNet thanks Fred Maia, W5YI, for permission to excerpt this Electronic
Edition of his W5YI Report.

o ARRL No-Code Panel Submits Report
---------------------------------
The special committee appointed by American Radio Relay League President
Larry E. Price, W4RA, has submitted its report recommending the creation of
a class of Amateur Radio license not requiring a knowledge of Morse code.
The panel was appointed at the direction of the League's Executive Committee
at its Baltimore meeting on December 10th.

The report was presented to the ARRL Executive Committee, which met on April
1. The Executive Committee did not take a position on the substance of the
report, but authorized its publication in full in the May issue of QST and
reffered it to the full Board of Directors for consideration during its July
21-22, 1989 meeting.

ARRL members, other licensed radio amateurs, and others interested in
Amateur Radio are invited to review the report and to make their views known
to ARRL Division Directors, whose name appear on page 8 of QST magazine.
You may also send your views to us here at the W5YI Report and we will see
```

to it that they find their way to the ARRL Board.

The mission of the committee was "...to explore the implications of no-code amateur license." To carry out this mission, President Price appointed a distinguished committee consisting of members from the ARRL Board of Directors, Amateur Radio industry and radio amateurs at large. In addition, consultants were designated from CRRL, the Canadian Radio Relay League and QCWA, the Quarter Century Wireless Association.

The Committee stresses that its proposal, if adopted, would not cause any licensee to lose any present privileges. It proposes a new class of Amateur Radio license, with a written examination somewhat more comprehensive than the present Technician exam ...but with no requirement for a Morse code examination.

Holders would be permitted to operate on all frequencies and with all privileges now available to Technicians above 30 MHz, except that 2-meter operation would be limited to frequencies between 144.9 and 145.1 MHz and to digital modes only. Examinations would be given only by accredited Volunteer Examiners, and distinctive call signs would be assigned.

The Committee carefully reviewed a wealth of input from interested individuals and Amateur Radio clubs, as well as information it had requested from International Amateur Radio Union (IARU) member societies in other countries which already have a code-free class of amateur license. A large number of alternatives were considered by the committee in developing its recommendations.

ARRL Executive Vice President Dave Sumner/K1ZZ stressed that the committee's report does not represent League policy at this time. The Board of Directors is the policy-making body of the organization, and as such will determine whether the report, with or without modifications, will become League policy.

He pointed out that the League is a representative democracy, with Directors elected to represent the members of their Divisions. Accordingly, anyone reading the report and wishing to have his or her views considered is urged to write the Director of their Division sometime prior to the July Board Meeting.

Note: The text of the ARRL's press release including the full report of the Committee is available in the CompuServe/HamNet LIB 7 Library.

o Part 15: Revolution in Non-Licensed Radio

The FCC has completed a monumental rewrite of Part 15 of its rules, which concerns technical standards for nonlicensed RF products of all kinds. These include so-called "unintentional" emitters such as computer products, video games and VCR's, TV and radio receivers, and other appliances; and "intentional" low-power transmitters such as cordless telephones, garage door openers, security systems, remote-controlled toys, experimental low-power stations, wireless microphones, anti-theft devices and intrusion

detectors. College campuses broadcast to dorms under Part 15 rules by feeding low power programming through a capacity into the AC power system. There are tens of millions of low-power Part 15 devices in operation today by the public.

The changes will introduce new types of RF devices on many frequencies, including amateur frequencies. The FCC also claims it will "clean up" the radio spectrum by tightening the emissions tolerances on receivers over a 10-year period. According to the ARRL's Perry Williams/W1UED, the League may petition the FCC to reconsider the action, particularly because of alleged potential interference to amateur operations.

The FCC said its action will "provide major benefits to the manufacturers of Part 15 devices ...and should also serve the public by enabling new technologies and new equipment categories that satisfy consumer demands to be introduced without the need for Commission rulemaking." The entire rewrite reduces the bulk of the Part 15 rules by more than two-thirds. Eliminated are all unnecessary and overly restrictive technical regulations.

The rules for nonlicensed use of low-power RF devices were established nearly 50 years ago when a manufacturer wanted to sell a "phono oscillator" device to transmit music from a phonograph to a radio. Over the years, Part 15 developed a device-specific approach, with the FCC modifying the rules each time a manufacturer successfully petitioned to allow a particular kind of RF device.

That eventually resulted in a patchwork of complex regulations, as well as FCC files bulging with letters from entrepreneurs who want to market devices not permitted by the rules. The FCC receives about 10,000 applications for approval of Part 15 devices every year. Low-power wireless data transceivers and consumer video transmitters are two popular "verboten" categories that will become legal as long as they comply with the new rules. (Some of these devices are available now in the illegal marketplace).

The video transmitters could be used to transmit from a VCR to TVs elsewhere in the house. They will have to operate on other than standard TV frequencies, using converters to supply final video and audio to the TV set. FCC staff emphasized that manufacturers and consumers will have to recognize the possibility of interference from authorized services to the nonlicensed Part 15 devices.

The FCC had not yet released the full text of the decision by our deadline, but here are highlights of what is now known about the new Part 15:

General limits: The new rules establish general emission limits for radiation and conduction. New Part 15 devices can operate on almost any frequency with any technical parameters provided they meet these emission limits. No longer will the Part 15 rules be "device specific". Devices are forbidden to operate on certain "restricted" bands that carry "critical" operations or require "extreme levels of sensitivity."

The restricted bands are mostly government and aviation frequencyes; amateur bands were not included in the restricted bands. The FCC also decided to

ban new Part 15 devices from TV broadcast channels, due to fears of interference to the coming multi-billion-dollar High-Definition Television (HDTV) industry.

Current channelized operations at 27 and 49 MHz would be phased out in favor of the consumer bands (below) and spurious emission limits for cordless phones and for general operation at 27 and 49 MHz would be tightened.

Consumer bands: The FCC has established additional new general-use Consumer Bands, within which higher emissions - up to 250 millivolts/meter at 3 meters - from Part 15 devices will be allowed (MHz):

13.553-13.567 26.96-27.28 40.66-40.70
49.82-49.90 902-928 2400-2483.5
5725-5875 MHz ...and 24.0-24.25 GHz

These last four "higher power" Part 15 Consumer Bands are also ham bands. The 902-928 MHz band is of particular concerns since the ARRL band plan provides for repeater inputs between 907 and 910 MHz and weak signal/experimental work at 902-902. There is concern that an unlicensed Part 15 device with a maximum range of 1,000 feet could inadvertently become long range by activating a nearby repeater. A worse scenario would be for the proliferation of 902-928 MHz devices to preclude effective future amateur repeater operation. Also raised is the possibility of communications by the unlicensed public with amateur stations.

Although the FCC Report & Order is not yet available, it is believed that the unlicensed field strength in the 902-928 ham band is set at 50 millivolts/meter at 3 meters. This is about half a milliwatt into a dipole antenna.

There is a provision that requires Part 15 devices to accept interference from authorized radio services ...but any interference caused by these devices must be corrected by the Part 15 user. Theoretically, if an unlicensed Consumer Band transmitter interferes with ham radio, its use must be immediately discontinued by the owner. One wonders how this will be received by a shopper who purchased an off-the-shelf consumer electronics contraption without being aware that its use is subject to these restrictions. Hopefully manufacturers will not be putting baby crib monitoring devices ...and other innovative gadgets on spectrum (especially 907-910 MHz repeater inputs) where it will cause difficulty for all. It may well be a non-problem ...but the potential is there.

It appears that products on these bands will be limited to antennas that are permanently attached, or that use a unique antenna connector.

Equipment authorization: The rules for authorization have been streamlined. Certain devices such as electronic watches, calculators and low power PC's are completely exempted from the rules if they do not require AC power. Special temporary authority and experimental licenses will no longer be required for testing devices to determine compliance with the regulations.

External inputs: Rules that allow only microphone input to devices such as awireless mikes and cordless telephones would be deleted.

Interference: FCC Deputy Chief Engineer Bruce Franca said that "there is concern by people that use the radio spectrum in the authorized services, that the services are being cluttered up with radio noise from devices, and so what we tried to do is balance allowing new devices and freedom for manufacturers, and at the same time clean up the radio spectrum. We've done that by imposing stricter standards on receivers and other Part 15 devices."

ARRL's Perry Williams was skeptical that the new Part 15 went far enough in reducing susceptibility of consumer products to RFI. He noted that the FCC has not used its legal authority to enforce sufficient RFI standards. "They're ignoring their obligation to protect the public," he said. Williams noted that tougher emission standards for receivers could reduce RFI susceptibility as well, due to measures such as better shielding. However, he criticized the FCC's decision to allow a lengthy (10-year) grandfathering of existing designs.

In earlier comments to the proposal, the ARRL argued vigorously against permitting increased usage of Part 15 devices, including consumer video transmitters, in bands such as 902-928 MHz which Amateur Radio shares with other services. It called the idea "foolish", and told the FCC that the ham receiving interference "would face the problem of identifying one or multiple interference sources, calling on all neighbors within that range to determine which one(s) had installed such a video transmitter (a continuous duty cycle device when operated); and the difficult or impossible chore of convincing the consumer that the device should not be operated."
[End this issue]

553. QT 4.0 TO BE RELEASED AT DAYTON

Newsgroup: rec.ham-radio

```

QUIKTRAK 4.0 Will Be Ready For Release For The Dayton Hamvention

AMSAT-NA is pleased to announce that QUIKTRAK version 4.0 (QT 4.0) will be ready for release on April 28, 1989. Those who will be attending the Dayton Hamvention will be able to obtain the first available copies of QT 4.0 at the AMSAT booth during the three days of the Dayton Hamvention. After Dayton it will be available from AMSAT-NA Headquarters. This "new" version of Bob McGwier's (N4HY) "premier" satellite tracking program not only retains many of the fine features of QT 3.2 but also allows the user more "flexibility" with the addition of several new features. For example, the number of satellites in which Keplerian data can be maintained has be increased to 100, up from the fourteen which QT 3.2 allowed; also, QTH data can now be kept for over 100 different cities. For those who have auto-tracking capability incorporated into their OSCAR station, with the up-graded "auto-tracking" capability added to QT 4.0, you can now designate up to fourteen different satellites to be "tracked" by your "auto-tracker" in the order of their appearance at your QTH. For OSCAR users who "hate to enter data," a new "full-screen editor" has been added to ease the "data entry" process. If you enjoy watching the position of the satellites being displayed on maps, QT 4.0 now supports EGA graphics; it continues to support CGA graphics with the user choosing between the two graphics modes by a simple entry in your QTH data file. And for those who enjoy making "visual" contacts with space objects, N4HY has not forgotten you! Bob has added a new feature which will inform you whether it will be possible to visually observe a satellite from your QTH for a given time-of-day and sunlight condition. And finally, the feature in which Bob McGwier is particulary pleased with is the "mutual visibility window" option. Have you ever wanted to set up schedule with another station on an OSCAR satellite but didn't want to have to run your tracking program for both QTHs? With this added "mutual visibility" option you will get a tabular listing of AOS, LOS, MA count, and duration for all "windows of mutual visibility" between your QTH and any of the cities you have entered in your QTH database. Also, for AO-13 users, QT 4.0 will give you the time of "minimum-squint-angle" between you and a selected city. For other satellites, for example, RS 10/11, this feature will give you the "time-of-minimum range" between your QTH and the city you select. So if you are looking for that "rare DX station," this new option in QT 4.0 will definitely take the guess work out of the problem. AMSAT-NA has adopted a new

policy on up-grades to QT 4.0 for those individuals who hold valid copies of older versions of the QUIKTRAK program. If you would like more information about this new "update" policy, please call Martha at AMSAT-NA HQ's at (301) 589-6062. [For owners of QUIKTRAK of 3.2 and earlier versions who will be attending the Dayton Hamvention, you will be able to "upgrade" instantaneously to QT 4.0 at the AMSAT booth. Just bring your original disk to the AMSAT-NA booth and it can be done on the spot.]

554. Re: College Forum at Dayton

Sorry 'bout this folks, but I couldn't get the mail to work to uxa.cso.uiuc.edu. I wonder when a DECENT e-mail system will be constructed?

I can't make it to Dayton this year, cuz I'm back in school. I am at Michigan State University (W8SH) working on a MSEE; eventually I will work on a Ph.D. I used to be in GR working in industry. As a matter of fact, I worked YOU when I was in GR on 2m, and maybe also on 70cm. (Oh, GR is Grand Rapids, MI. Sorry for using the abbreviation, but I'm so used to it.) You should have gotten the QSL card I sent by now. I was in EN72eu; my callsign is N8DGN.

I used to be at Michigan Technological University (W8YY) for my BSEE '86. I have contacts up there in the MTU Amateur Radio Club via e-mail.

I would appreciate it if you could forward any info to me here. In turn, I will forward it up to MTU.

Have fun at Dayton. Oh, if you could, would you please look at the new Kenwood TH-75A dual band (2 & 70) HT. I am interested to find out its size in comparison to the TH-25/45/55AT. I would also like to know if it truly has "resume on carrier drop" scanning. What is the suggested price? If you can't get all of this info, I understand. However, I will greatly appreciate any information you can pass along.

I am compiling a list of countries which adopted a standard
AM stereo system (such as Motorola's C-QUAM). I am especially
interested in knowing about Australia, New Zealand, Brazil and Canada. Eahc of these
countries was in the process of selecting a standard,
and I believe each did, in fact, select Motorola. Any information
on the percentage of AM stations in those or any other countries
with a stereo standard or sources of this information would be
appreciated.

I've been watching the ongoing discussion regarding repeater coordination, and I've a thought...All the discussion so far has been regarding 2meters, 220 and 440...Now, being out here in California, I'm quite aware of the status of the above bands, But what about 1.2Ghz, here we have a band that at least in areas other than LA, is practically empty. Looking at the ARRL directory (No flames: I know that publication is *not always accurate*..), we see that in most areas of the country, 1.2gHz appears to be unused, why not put some of the hi-tech/lo-use/private systems here? Our group here in San Diego has done this..We have a 220/440 remote base on 1.2gHz and it's only the second 1.2 system in SD....ICOM makes a great repeater and HT and Yaesu and Kenwood make great mobiles, at a slightly higher price than 440 stuff tho...coverage is good and you'd be surprized at the weird places you can hit the repeater....Just a thot.....

Discussion to !crash!pro-sat!dfrandin

Flames to /dev/null.....

THE DIFFERENCES IN THE TUBES ARE NUMEROUS AND A BRIEF TRIP TO THE ARRL HANDBOOK OR ANY OTHER COMPETENT REFERENCE DIGEST WILL PROVIDE YOU WITH THE TECHNICAL PARTICULARS; I.E. VOLTAGES, MAXIMUM USEABLE FREQUENCY, ETC.

ONE DIFFERENCE RELATIVE TO TUBE LIFE IS COOLING. THE 3-500Z IS A GLASS ENVELOPE TUBE AND THE 3CX800A7, 3CX1200A7 AND 8877 (3CX1500A7) ARE ALL CERAMIC/METAL ENVELOPES WITH FORCED AIR COOLING FINS. SO, PHYSICAL CONFIGURATION IS ONE DIFFERENCE.

ANOTHER DIFFERENCE IS PLATE POWER DISSIPATION. THE 3-500Z IS CAPABLE OF DISSIPATING 500 WATTS SAFELY. HEAT DISSIPATION IS ROUGHLY EQUAL TO THE DIFFERENCE BETWEEN POWER INPUT AND OUTPUT. AT 60% EFFICIENCY, 1500 WATTS OUTPUT REQUIRES 2500 WATTS INPUT LEAVING 1000 WATTS (REQUIRES A PR OF 3-500Z'S) TO BE DISSIPATED. FOR COMPARISON, THE 3CX800A7 DISSIPATES 800 WATTS, THE 3CX1200A7 DISSIPATES 1200 WATTS, AND THE 8877 (3CX1500A7) DISSIPATES 1500 WATTS IN A SINGLE TUBE.

ANOTHER DIFFERENCE OF SIGNIFICANCE IS DRIVE POWER REQUIREMENTS FOR A GIVEN OUTPUT. THE 3-500Z AND 3CX1200A7 REQUIRE APPROX. 100 WATTS INPUT TO ACHIEVE 1500 WATTS OUT AND THE 3CX800A7 AND 8877 REQUIRE APPROX 80-90 WATTS IN FOR

1500 WATTS OUT.

ANOTHER IS MAXIMUM OPERATING FREQUENCY: THE 3-500Z TOPS OUT AT 30-40 MHZ AS DOES THE 3CX1200A7. THE 3CX800A7AND THE 8877 ARE USEFUL UP TO 220 MHZ OR S0. AS THE EFFICIENCY AT FREQUENCY IMPROVES, SO DOES THE PRICE.

THE ORDER YOU NAMED THEM IS ALSO THE LOW-TO-HIGH PRICE RANGE WITH 3-500Z AVAILABLE IN THE UNDER-$100 RANGE TO AROUND $850-950 (LAST TIME I LOOKED) FOR AN 8877.

CHOICES ARE NOT STRICTLY PURCHASE PRICE OF TUBE (TRANSISTOR) DRIVEN. OTHER CHOICES INCLUDE PHYSICAL CONFIGURATION OF THE AMPLIFIER, OPERATING FREQUENCY, OPERATING RESERVE FACTOR (ICAS or CCS) AND SUCH MUNDANE CONSIDERATIONS AS THE INSTANT WARM-UP FEATURE OF THE 3CX1200A7 -- WHICH ALLOWS ONE TO FLIP THE AMPLIFIER POWER SWITCH ON AND BEGIN TRANSMITTING WITHOUT WAITING FOR FILAMENTS TO WARM UP AS WITH 3-500Z'S.

SOLID STATE AMPLIFIERS REPLICATE THE FEATURES AND FUNCTIONS OFF TUBE AMPLIFIERS BUT ARE ALMOST ALWAYS NO-TUNE IMPLEMENTATIONS. SPECTRAL PURITY IS ACHIEVED BY A SERIES OF BANDPASS FILTERS. EFFICIENCY OF SOLID STATE AMPLIFIERS IS LOWER (45-50%). ONE MAJOR CONSIDERATION FOR SOLID STATE AMPLIFIERS IS THE INPUT POWER WHICH IS IN THE 90-100 AMP RANGE AT 12 VDC - A STRAIN ON MOST STANDARD AUTOMOTIVE ALTERNATOR SYSTEMS. AT THE INHERENT EFFICIENCIES OF SOLID STATE DEVICES, IT WOULD REQUIRE OVER 200 AMPS AT 12 VDC OR 100 AMPS AT 24 VDC TO PRODUCE A 1500 WATT SIGNAL. FOR THAT REASON AND ALSO THE NEGLIGIBLE GAIN OF 1500 WATTS OVER 750-800 WATTS, MOST SOLID STATE AMPLIFIERS ARE LOWER POWER OUTPUT THAN TUBE AMPLIFIERS. THE PRINCIPAL ADVANTAGE OF SOLID STATE AMPLIFIERS IS FOR MOBILE OPERATIONS.

TUBE AMPLIFIERS ARE AVAILABLE IN YOU-TUNE OR NO-TUNE CONFIGURATIONS. THE NO-TUNE VERSIONS, DUE TO ADDITIONAL COMPONENTRY FOR BROADBAND TUNED CIRCUITS AND BANDPASS FILTERS, ARE MORE EXPENSIVE.

THE CW POSITION ON LINEAR AMPLIFIERS IS THE NON-LINEAR CLASS C AMPLIFICATION MODE, THE MOST EFFICIENT FOR CW . THE SSB POSITION IS THE LINEAR MODE, AB1OR AB2.

RTTY CAN BE FREQUENCY SHIFT KEYED (FSK) OR AUDIO FREQUENCY SHIFT KEYED (AFSK). FM AND FSK SHOUOLD BE TRANSMITTED IN THE SAME MODE AS CW. AFSK (INCLUDES PACKET) SHOULD BE TRANSMITTED IN A LINEAR MODE SINCE IT IS A TONE-MODULATED SSB SIGNAL. THE CW/SSB MODES OF LINEAR AMPS ARE "ALL-MODE" (EXCLUDING PULSE APPLICATIONS) ALBEIT LINEAR AMPLIFICATION OF AM TELEPHONY IS NOT THE MOST EFFICIENT, IT DOES WORK.

FCC LAW PROHIBITS MANUFACTURER AND SALE OF AMPLIFIERS FOR OPERATION ON 10-11 METERS. IF YOU POSSESS A VALID AMATEUR RADIO LICENSE, MOST MANUFACTURERS WILL PROVIDE YOU THE NECESSARY INFORMATION TO MODIFY THEIR AMPLIFIER FOR 10-METER OPERATION.

IF YOU HAVE WORKED 10-METERS MUCH, I WOULD PERSONALLY WONDER WHY YOU WOULD WANT SUCH A DEVICE. 100 WATTS PROVIDES WORLD WIDE COVERAGE WHEN THE BAND IS OPEN AND THE 10 DB OR SO GAIN FROM AN AMPLIFIER WILL NOT FORCE THE BAND OPEN WHEN IT ISN'T. AT BEST, IT CAN EXTEND BAND OPENINGS BY A FEW MINUTES.

A GOOD ANTENNA SYSTEM IS A MUCH BETTER INVESTMENT!

NOTE: ALPHA LINEARS ARE CONSIDERED THE ROLLS-ROYCE OF THE AMPLIFIERS AND PRICED ACCORDINGLY. HOWEVER, THE TUBES IN ANY LINEAR (OR TRANSISTORS) CANNOT WITHSTAND CONTINUOUS ABUSE WITHOUT SERIOUS DEGRADATION. ALPHA WOULD BE HAPPY TO RESTORE YOUR CLUB LINEAR TO PROPER OPERATION AT REASONABLE COST COMPARED TO PURCHASING A NEW ONE. IF YOU CHOOSE TO EFFECT REPAIRS YOURSELF, PAY CLOSE ATTTENTION TO FILAMENT VOLTAGE AT THE TUBE BASE(S) - THEY MUST BE WITHIN PLUS OR MINUS 5% OF MANUFACTURERS RATING ELSE SERIOUSLY DEGRADE THE LIFE OF THE TUBE. BE SURE TO MEASURE THE VOLTAGE AT RMS VALUE. MOST DIGITAL VOLTMETERS OR AN IRON-VANE AC VOLTMETER WILL PROVIDE TRUE RMS READING. 73 KB6CSP

A possible solution to the problem of getting a repeater pair for packet use may be a time division schedule. Let the repeater be available for voice use during rush-hour and other popular times, and do packet message forwarding, etc during the dead of night (2AM-4AM), and maybe during low use times when most of the voice users are at thier jobs. Allow breaks in the packet time so emergency voice traffic can get through.
I imagine that some low use repeater users (like those semi-private machines) may like having thier machine be put to some use late at night when everyone's in bed, so they can have more reason to keep the frequency pair for thier semi-private voice use during the day. Just an idea....

I'm probably the only listener in the NYC area [:-)] who owns a stereo AM radio. But there's nothing worth listening to (no music to speak of, I mean any music, trying not to make my musical tastes enter the picture). There's a all news station that is in stereo, but what's the point of that? Also, the interference (powerline crud from florescent lights, etc) makes FM more attractive. In Australia, they seem to have a more healthy AM industry, maybe because they did pick a standard (maybe a bad choice, but it *was* a choice) and they did it before thier AM started to die. There was powerline crud there, but not as bad isain USA.

I have had a Hy-Gain 14AVQ for 21 years. It's been ground mounted and roof mounted. 'No problem w/SWR ground mounting it but you do need proper radials for the roof.

I'm still using it (at its 4th QTH).

The newer 14AVQs are more broadband. BTW, the 14AVQ is for 40, 20, 15, and 10 meters. 12AVQ is same less 40 Meters. The 18AVQ is same as the 14AVQ plus 80 meters.

I would buy another one.

>this is because IT IS *NOT* EFFICIENT. It is REDUNDANT. You leave a carrier
>on for many milliseconds that's doing nothing at all but being there.

Phil, although I suspect your comment was tongue-in-cheek, I think I should elaborate on it a bit.

Any digital modulation system will perform better in the presence of noise if you slow it down. This is true for AMSAT-style PSK as well as Morse Code. But "efficiency" depends on more than transmission speed. The proper way to evaluate power efficiency is to look at the "Eb/N0" ratio required to reduce the error probability to a given point. "Eb" is the energy per bit in joules (watt-seconds), and "N0" is the noise spectral density in watts/hertz. N0 depends on the channel and the receiver front end; it is not affected by anything the transmitter can do. Eb is equal to the transmitter power in watts divided by the data rate in bits per second, so it is obviously affected by the data rate. Halving the data rate while keeping everything else constant increases the Eb/N0 ratio by 3 dB. Any power-limited system will perform a *lot* better with a 3 dB Eb/N0 increase.

The proper way to compare Morse Code to other, more modern transmission techniques is to compare the achievable data rates for each scheme given the same transmitter power, the same channel bandwidth and the same channel noise level. Once you compare them on a "level playing field", you will find that any well-designed automatic digital system will outperfom manually received Morse by a substantial margin.

For example, by using an automatic digital system, you could achieve your 1 WPM capability with much less transmitter power than that required by manually received Morse. This is especially so when you consider that an automatic system can be easily scaled to operate over a wide speed range, but manual reception of weak-signal Morse is limited by the filtering ability of the human brain to effective bandwidths of 50 Hz or so. In other words, the Eb/N0 performance of manual Morse suffers greatly at very low speeds, so it becomes even less efficient than machine techniques.

Let's take a look at your comment about "redundancy". Yes, slowing down a transmission constitutes a form of redundancy. You can think of it as a particular form of forward error correction (FEC) called "repetition coding", where each symbol is sent several times and the results averaged to reduce the error probability. In your case, the redundant transmissions of each element happen to be immediately adjacent.

But repetition coding is a power-inefficient form of FEC. The Eb/N0 performance curve remains unchanged, you're just operating on it at a

different point. There are ways to add redundancy to a signal that actually DECREASE the Eb/N0 required for a given error probability (i.e., shift the error probability-vs-Eb/N0 curve to the left), but they require machine reception. This is the idea behind convolutional codes and block codes. These schemes increase the raw channel bit rate and the required bandwidth, but in return they allow you to DECREASE your transmitter power.

For example, the "rate 1/2 constraint length 7 convolutional code" used on the Voyager probe has a coding gain of about 5 dB. Let's say that without convolutional coding I could send 10,000 bits/sec with a transmitter power of 10 watts. By coding, I can drop by transmit power by 5 dB (i.e., to about 3 watts) BUT I CAN KEEP SENDING AT 10,000 BIT/SEC! This is not true for repetition coding; if I had to drop my transmitter power to 3 watts and use repetition coding to maintain the same error rate, I'd have to slow down by 5 dB, i.e., to about 3,000 bits/sec. That's a big difference.

Another place where coding pays off handsomely is the Compact Disk. The use of a Reed-Solomon block code allows you to put far more on a disk with a given audio quality than if you just made each pit on the disk bigger to make it less susceptible to surface defects.

The are two costs to these schemes: you need more bandwidth, and you need hardware (and probably software) on the receiving end. The former is not a serious problem when operating at very low data rates (they're certainly more bandwidth-efficient than CW in a 400 Hz channel!) and the latter is being addressed by the DSP projects. But we need more tekkies to help develop this stuff for the mass amateur market, and these people are highly unlikely to be interested in learning the Morse Code...

This is a list of files available from the RADIO MODS archive.

FILENAME DESCRIPTION of MODIFICATION
-------------- ------------------------------------------------

INTRO MODS Introduction to the archive.

RADIO MODS The file you are reading now.

TH215 MODS Extend frequency coverage of this hand held.

TS711 MODS Extend frequency coverage from 141.0 to 150.995mhz.

TS440 MODS Extend TX to full RX, add 10HZ digit display.

ALLBAND MODS Extend TX on many Kenwood and ICOM radios.
The list includes IC-02AT, Yaesu 757GX, Kenwood 2600,
TS-430S, TS-940, TS-930, TS-440, IC-720,
IC-735, IC-745, IC-751, Icom M-700(Marine HF)

PRO2004 MODS Add cellular coverage to scanner.

PRO34 MODS Add coverage to the scanner.
TM2570A MODS Extend freq rx/tx 141.0 - 150.995mhz 2530/2550/2570A

IC28 MODS Extend TX 138 - 174mhz IC-28A & IC-28H

ICOM32AT MODS Info on hand-held
IC32 More info on Icom handie, this file is different
than ICOM32AT MODS.

FT23R MODS RX/TX 140.0 - 163.995mhz.

FT727R MODS rx/tx 139-160mhz 420-460mhz

760XLT MODS Extending frequency coverage to this scanner.

TM721 MODS Turn the Kenwood dual-bander into a repeater.
TM721-2 MODS More info on TM721 rig.

IC900 MODS Expand RX/TX on many modules/bands

FT411 MODS RX 130-174 TX 140-150

R7000 MODS Fix the flaky display & loss of gain.

TINY2TNC MODS Mod/Fix for hard-of-hearing TNC.
```

** Since I do not personally own every piece of radio equipment
available, I can not insure how accurate are the various mods.
Questions with specific mods should be directed to the
original poster.

The Icom unit is a regulator that can operate at a low in-out differential voltage. It also provides filtering, reverse polarity protection and spike protection.

>diodes in series to drop the voltage from a 12v battery by .7 volts at a
>time would work. My 2AT runs on voltages between 7.2v and 10.8v and it

The diodes would work but don't provide very good regulation and would pass voltage spikes right through (and there are some humdingers in a vehicle). Diodes only drop 0.7 volts at a certain current value, at other currents their voltage drop varies from close to zero up to a full volt or more. In order to guarantee the 0.7 volt drop you may have to install some extra load to guarantee a minimum current (the radio's receiver may be enough -- it depends on the diode). However when the radio is first turned on the higher voltage will be briefly present -- probably not a problem but difficult to be sure.

>should work nicely on 10.6v off of a car battery with 3 diodes, though I plan
>to drop the voltage more than that. In addition, I plan to put in an inductor,
>cap, fuse, reverse biased diode for reverse polarity protection, and maybe
>even a crowbar circuit just in case the voltage goes too high.

Looks like a workable plan but I'd SURE put some overvoltage protection in. At least a zener. On the other hand, a 'real regulator' circuit isn't any more complex than the diodes, etc., and provides more constant output voltage especially in the presence of drooping input voltage.

I built a regulator for Icom 2AT using the LM 317 in a BP-4 battery case. It worked quite well but not quite as well as the Icom unit in some characteristics. Specifically the minimum voltage drop of the Icom unit was very low (don't have the figures but remember less than one volt) and the 317 was more like 1.5 or two volts. This is a non-problem in normal mobile use but when operating from a 12volt gel battery that is nearing exhaustion the Icom unit did power the radio a bit better. The Icom unit did have one disadvantage though, the idle current was higher than the 8ma or so of the LM317. (memory of something like 60 ma) Since that time there are regulators that have better in-out characteristics than the 317, so it could be improved on.

After reading QST issues from the early 30's to present, I find that ARRL printed policy,
including editorials, selected correspondence in the letters column, and content of articles in general, would not only have me run CW exclusively, but run QRP and send long chains of numbers and punctuations in an endless 'make work' excercise to see how much pointless information can be propagated all over the place. Why not just get a job as a keypunch operator instead? At least it pays a little.
Don't get me wrong about CW's place, I have enjoyed many long ragchews on CW, though this was probably due to my lack of funds. When in upgraded to general at the age of 14, I found that everybody had already switched to SSB and would not talk to AMers. I was forced back to CW where I stayed for some years except for occasional 10 band openings. AM was still okay there.

>
>The ARRL types I've spoken to over the past couple of years (except for
>my Director) have been against no-code.

Yes, that's the feeling I have always gotten from reading QST.

>
>> Just wait, sooner or later, Wayne Green will claim it was all his idea
>>in the first place.
>
>He already has, no doubt.

With good reason. I have read Wayne Green's columns in 73 and Electronics Illustrated since 1966. He has always been proclaiming the demise of ham radio due to code requirements and incentive licensing. While Wayne is a firebrand who writes provoking articles to increase circulation, at least his crackpot ideas are amusing. QST's editorial has always been very conservative and boring.
On reflection, I believe Wayne was right about incentive licensing also. I have never seen the good in it. Its just another certificate for the certificate chasers. Lets go back to novice, general, and extra with no extra privileges.

571. Sony Aircraft Headset

Newsgroup: rec.ham-radio
Date: 1989-04-26 20:42:00 UTC
From: commgrp@silver.bacs.indiana.edu
Message-ID: <12600054@silver>
Source record: 19040

Sony makes a lightweight aircraft headset (model DR-6010) similar to their tiny "Walkman" earphones which do not cover the ear, with a small electret microphone on a flexible "gooseneck." These are said to be in service on Japanese airliners.

Sporty's Pilot Shop wants $200 for the headset, $130 for earphones only; that's an enormous markup, even for airplane stuff! (Yes, they're FAA-certified.)

Has anyone seen a reasonably-priced ham version of these headsets?

BTW, "simulated carbon" telephone and aircraft microphones/headsets (e.g., Plantronics MS-50 and "StarSet") work with many modern ham rigs, unmodified. They have dynamic or electret mikes with a preamplifier to give them the electrical characteristics of a carbon mike (variable resistor), and are powered by microphone bias current from the radio. They are expensive new, but cheap and plentiful at hamfests. Reference: _Ham Radio_ October 1981.

> comments on this method?

Chris, I think you're on the right track but the use of a string of forward biased diodes to drop the voltage looks like false economy to me. The use of a 3-terminal regulator or a 1-transistor regulator circuit (emitter follower configuration with Zener diode supplying the base voltage) isn't much more complicated but will provide *much* better voltage regulation and a smaller filter.

The first trap is at the point for 10 meters, i.e, the lower half
of the antenna is a true half wave at 29 MHZ. or so. The traps are
for 12 and 15 meters. 14 MHZ is then the length of the antenna minus
the shortening caused by the series inductance. The matching network
is basically a toriod transformer. There is a capacitor or two in there,
but the big interest is the toroid. To tune the beast you work up
from 10 meters. 12 meters is not tuned, but the fixed tune is fine.

574. HDTV Technical Transmission Standard

Newsgroup: rec.ham-radio
Date: 1989-04-26 23:03:47 UTC
From: klopfens@bgsuvax.UUCP
Message-ID: <4064@bgsuvax.UUCP>
Source record: 19038
Cross-posted to: rec.ham-radio,rec.audio,rec.video,sci.electronics

Do any engineers out there (or anyone else) know the current FCC position on setting technical standards? Is the FCC mandated by law to set technical standards such as HDTV or can the FCC simply let broadcasters choose any HDTV transmission standard they want? (I understand that a production standard is a completely different story.)

I had always assumed that it was the FCC's responsibility to set these standards, but the case of AM stereo seems to suggest differently (although maybe the fact that stereo was only a modification of the existing system made a difference; if so, then maybe the FCC will allow any NTSC-compatible HDTV system to fight it out in the marketplace).

I don't agree. I just came back from Hawaii. Going thru the xray machine
in Worcester, Ma, they saw my airplane transceiver, had me take it out,
turn it on and get a VALID station (126.55 was ATIS) just to verify that
it was in fact a real radio and not "loaded" with something.

Coming back from Hawaii, they did that not only to my transceiver but also
to the camera.

>>values differ.
>But Jay, you ARE making an implicit value judgement! "First-come, first
>served, and nothing else matters" is just as much a value judgement as
>"FM over SSB" or "voice over packet".

Nope...first-come, first-served is nothing more than objective, and a
realization of the simple fact that it's next to impossible to move or
shut down a repeater without the consent of the trustee. Given that,
it's only common sense to implement rules that will be respected and
work.
We aren't saying "FM over SSB" or "voice over packet". If you want to
put up an SSB repeater, or a duplex packet repeater, fine. Go for it.
All we ask is that you follow the rules.
(I won't get into the myriad problems associated with SSB repeaters...
but experience shows that, at least as currently implemented in the
two-way world, they leave a LOT to be desired.)

>You keep claiming that there are no other objective criteria by which
>you can assign priorities to competing requests for spectrum. But if you
>look back at the article I posted the other week, you will see that
>almost every potential criterion on my list has a clearly objective,
>quantitative measurement associated with it. For example, it ought to be
>obvious to all but the most obtuse frequency coordinator that SSB takes
>about 5-6x less bandwidth than NBFM, and that packet is quantitatively
>far more efficient in moving formal message traffic than reading it by
>FM voice. These comparisons involve hard numbers. They are not
>subjective value judgements.

The hard numbers are there, but that they should be involved in
coordination decisions is where we differ: the consideration that one
repeater is better than another, and therefore should be given priority
in coordination, is a value judgment.

>What is admittedly difficult to resolve, however, are the relative
>WEIGHTS that should be applied to each of the various objective criteria
>when you're arbitrating a dispute between dissimilar groups. For
>example, how much weight should be given to a large RTTY group that is
>competing with a smaller packet group for a given amount of spectrum,
>considering that packet is much more efficient in its use of spectrum?

That's not just difficult to resolve, it's flat impossible. You'll never get the respective groups (no matter what the criterion) to agree that the choice you make is the right one if that choice goes against them. They will always argue the decision, and will eventually flout it.

>This is something that has to be worked out through open discussion, >with each group having its say. The ultimate goal must be to meet the >raison d'etre of the Amateur Service as much as possible. Sticking your >head in the sand and clinging to the first-come-first-served rule come >hell or high water simply isn't going to produce an amateur service that >is capable of holding on to its frequencies.

This kind of thing won't get worked out in open discussion; it'll get endlessly argued in open discussion, with no option being generally acceptable. If a solution is imposed, there will always be a disgruntled faction, and the accumulated weight of unhappiness will eventually bring the system down, producing the repeater wars that Fred Goldstein wants. He's the only one I've ever talked to that does, though.
The great advantage of the first-come-first-served rule is that it's fair, equitable, and working.

Speaking of holding on to frequencies, why can't these new users populate the other frequency bands? We're going to lose the higher bands if we don't use them, and if people put as much effort into populating 902-928 as they did in fighting the coordination system, we'd never be in danger of losing it.

>into a "war" of any sort.

Absolutely. The job is political.
The "solutions" I've seen so far ignore political realities in favor of
technical fun. I'm not anti-techie, despite some comments I've seen, but
the ham population is larger than that, and a significant number of
people don't care about anything but hearing a kerchunk when they let
off the mike.

Why not, indeed?
I agree that we need to populate bands besides 2, 220, and 440. If we
don't use them, we will most assuredly lose them.
Why can't the new users use the higher bands? There's an enormous amount
of spectrum available. Packet could have hundreds of channels.
Instead of populating the higher bands, though, all we see is
complaining about how all of 2 meters is full.

In article <485@jfcl.dec.com> frg@jfcl.nac.dec.com.UUCP (Fred R. Goldstein) writes:
>Repeater wars were disastrous to those who didn't expect them, or
>who didn't know how to cope with them. Malicious interference was
>part of some such wars, and should not be condoned. That's different
>from the "wars" that go on constantly on the DC bands, where QRM is
>simply expected.

Malicious interference was part of ALL such wars that I've ever heard
of, as well as a lot of other, even less savory things. Do you really
want that? I don't. As Mike Waters has said, that kind of thing is even
more damaging.

>Co-channeling repeaters where they are warned that they have some
>overlapping coverage is not the same as putting two open repeaters
>five miles apart on the same pair. Commercial users have gone
>to PL, anti-PL, etc.; these techniques work, especially when the
>primary coverage areas differ but secondary areas overlap.

These techniques may work in the commercial world, but there is no
covenant there. There is one in the amateur coordination field. We can't
unilaterally overturn that covenant.

>Even a binary priority is a priority. Guy On The Air has priority over
>Guy Not On The Air. I see it as quite politically possible to change
>this, though the Guys On THe Air (once every month) won't like it.

If we were to try this, we'd be thrown out and a group that doesn't want
to change it would be installed in our places. After all, we're
violating our gentleman's agreement.

>If I were to go to my local coordinator and say I wanted a packet
>repeater-pair, and he followed your rules (I don't know whose he
>follows, so this is a hypo), then he'll say, "fine, get on the
>waiting list." I'll no doubt have my channel by April 1, 2007.
>That's not a marketplace issue -- lots of semi-idle repeaters still
>take up frequencies.

No, you'll have your channel sooner than that. Besides, there's always
1.2, 900, ...
The semi-idle repeaters have made an agreement: they put up (to a
certain extent) with us telling then where they should operate, and
within what technical parameters, and we protect them. We can't
unilaterally change that, and that's exactly what you're calling for.

>Again this may stem from experiences -- mine in NYC differ from yours
>in TX. (It's more peaceful in NE where I live now.) A few repeater

>overlaps were annoying, but owners worked things out in various ways.
>So long as everyone knew that they had no God-given right to total
>exclusivity, and didn't cause MALICIOUS interference, things worked.
>I have heard some obnoxious californians who obviously needed more
>uh pursuasion.

During the 20 kHz discussions, this was a common thread: "They use
upright 15 kHz channels in the Northeast, why can't we here?"
People who had operated there, and who had moved here, were unanimous:
repeaters there were much less usable than they are here. Lots of
interference, and lots of arguments, and lots of adjacent-channel
problems. The users and trustees of Texas repeaters decided they didn't
want that.

>Still, coordinators have more options than to simply make waiting
>lines and leave all intact allocations totally free of sharing.

Technically, you're correct.
Politically, it's impossible to implement.

Source record: 19052

For what its worth, high-qyuality variable-bandwidth (or at least selectable-bandwidth) AM receivers were available as hi-fi components up until the growth of FM and FM-stereo eliminated their market. I have a McIntosh MR-66 (if I'm recalling the model # right) AM-FM tube tuner as part of in a hi-fi system; this was their last FM-mono tuner model with provisions for an outboard multiplex adapter. There are 4 AM bandwidths (don't recall the actual specs), and it was one of the tuners designed to feed AM to one channel and FM to the other for two-station cross-band stereo simulcast broadcasts, which were briefly popular prior to FM-stereo. Using the narrow bandwidths allow reasonable AM DXing, and the wider ones provide good sonics on daytime locals. (Lots of heterodynes on wider bandwidths at night, of course.)

I'm going to be visiting Israel (Tel Aviv) May 10-24, which includes the weekend of the CQ-Mir contest. I'd like to hear what the contest and DX world sounds like from 4X, as well as just meet a few amateurs there. I realize that serious contesters don't encourage visitors during contests, but there might be clubs or ops who do contests the way I do them, for - gasp - fun. Anyone know of any leads? I have been in e-mail contact with Yossi Sharon 4X1BQ, who posted here not long ago, and would welcome comments or suggestions by anyone who has operated from 4X or who at least knows who to contact there for a non-disturbing visit.

Shalom* -

>Therefore, the more radials you have, the better the "image"
>of the antenna will be formed and the more efficient the radiator will
>become. BTW- you don't have to use all 1/4 wave radials- put at least one
>of these for each band, but the others can be longer, shorter, etc. Many
>short radials is better than a few long ones.

Hmmm... What about just putting down a lot of metal screening over the roof and electrically connecting it to the radials, or eliminating the individual radials themselves entirely in that case? I often see (and have scarfed up) thrown-out screens and screendoors which have copper screen fabric on them. If you ran across a pile of those at a place where the old storm windows and screens are being replaced by new windows, it could be a free source of a roof's worth of groundplane.

I can see possible problems with this idea; are they realistic concerns?

a) Used screening is pretty oxidized, so it might be considered to be a mat of individually-insulated wires, making electrical contact only at random places. Could these myriads of poor and good connections act as rectifiers and introduce spurious-signal generation? There might also be difficulty in soldering the pieces of screen together to make a fully-connected mat. Or would the RF currents just ignore the thin oxidized layer and act as though the screening was conductive at those frequencies? (If the RF power level was high enough, maybe you could melt the screen together without soldering, or use the RF to melt the solder at the joints! :-) (I realize the original inquirer was concerned about this, and it is not likely to happen with legal power levels... I did like the image it brought to mind, though... :-)

b) If you use new screening, I don't know if you can get copper any more; it may all be aluminum or non-conductive synthetic. I don't know if aluminum screen would be good enough -- the individual wire strands would have an oxide coating and be less likely to make good contact in the interweaving than the copper would. If new copper screenwire is available, it is likely to be so expensive that this idea would be laughable. And if there are problems with oxidizing joints as speculated above, it would happen to new wire as it aged in this high-exposure application anyway...

Also, the birdies would get their little feets caught and then cook... :-((Either in the sun or from the RF...)

Hmmm, if you are building a new structure, or putting on a new roof, what about the idea of a layer of copper screening UNDER the roofing material? That would isolate it from the elements, and a few suitably-placed lines could be run out to where the vertical would eventually

be mounted for tying into the groundplane. Hmm, in THIS case you could use aluminum foil! (Heavy-duty bar-b-que grade Reynolds wrap, I suppose, as opposed to the cheapy thin stuff from K-Mart... :-) Some slab insulation material has an aluminized layer -- would that be usable as a groundplane? (Might need jumpers between sheets to insure electrical continuity...)

Well, that's my idle speculation for this topic for the day... Anybody out there actually done anything like this?

Regards, Will Martin

585. Re: Crossed-Field Antennas

Newsgroup: rec.ham-radio
Date: 1989-04-27 17:44:39 UTC
From: charlier@hplsla.HP.COM

Source record: 19054

>The March 1989 issue of Electronics and Wireless World has an
>interesting article on a new class of physically small transmitting
>antennas whose physical size is unrelated to the wavelength of
>the operating frequency. The antennas, called crossed-field antennas,
>are reported to have excellent radiation efficiency, wide bandwidth
>and excellent recieving qualities, and according to the authors,
>there appears to be no restriction in physical size- they can be made
>as small as possible.

This article grabbed my attention also, and I must confess I double
checked the month on the cover. But it looks reasonable.

Electromagnetic radiation is mathematically modeled using the Poynting
vector, which is basically proportional to perpendicular portions
of the electric and magnetic field intensities. In a garden variety
antenna both fields are generated by the same current flowing in
the same conductor.

Kabbary, Hately, and Stewart claim in their article that they synthesize
the E and the H fields separately, thereby producing 'vertically polarized
radio waves of intense power density'. Their mechanism for doing this
is to use a pair of parallel circular plates to generate the H fields.
These plates are driven by roughly half the transmitter power.

A pair of cylinders is positioned collinearly with the plates, one
above and one below. These cylinders are driven by the other half of
the power, and generate an E field perpendicular to the H field
generated by the plates. Thus the Poynting vector 'points' outward
radially. I would imagine that the radiation pattern resembles a very
high-gain vertical. They claim that their antenna is roughly 1/100th
of a wavelngth in size, and has a bandwidth of 30%. This translates
to a high-gain (low radiation angle) 80 meter antenna that is a foot
or two high, and has a bandwidth of 1 MHz!

Unfortunately, the article is a bit scanty on practical details. This
is perhaps because the authors are applying for a British patent on their
antenna. This sure would be an interesting area for the amateur
experimenter! Just what do the impedances of the two parts of these
antennas look like? What are the phasing requirements? Has anyone
seen anything else on this?

(The above explanations are crude and subject to my extremely rusty
recollections of field theory)

:The previous poster did an excellent job of reviewing the technical
:difficulties of AM radio. The thrust of my question, however, is
:should the FCC abandon or follow its own precedent in not selecting a
:standard system as it did with AM stereo.

Yes, the FCC should make standards decisions based on sound technical principles, including an intelligent assessment of the ability of technology to improve the implementation of the standard. Whether the FCC is in fact capable of such wisdom is open to question; the misinformation in the "standard encryption" inquiry does not bode well for the future. The last FCC broadcast standards decision of some elegance was the adoption of NTSC color, back in the fifities.

:Also, I am still interested in knowing if there is any *evidence* that
:listeners prefer mono to stereo or vice versa. (We have 2 ears, so I
:assume stereo is preferable; my reviewer wants more proof.)

Other things being equal (which they rarely are), stereo is better than mono. Everything I've read indicates the average listener agrees. If stereo weren't so desireable, CBS wouldn't bother to lie about it with their "CBS StereoSound" scam.

However, since most AM stereo receivers have CQUAM with its well documented problems, the listener may prefer a stable mono signal to the only AM stereo he has ever heard.

>It's a real shame we have the ECPA. I'd love to play a tape of a typical
>cellular radio conversation to the FCC and ask: "You want to take our
>frequencies for THIS??" :-)

I had an intermod problem with my 440 machine when I started it up, if the local Bell mobile relay (450 something I forget) was up at the same time as my transmitter then I got BOTH. I remember listening to a fascinating conversation between someone and his lawyer about fixing a speeding ticket. I am not sure if the lawyer was just cautious or it was true, but he claimed it wasn't possible in Phoenix.

I wish I had had my recorder going because thew non-lawyer got quite upset at this and named some rather well known officials. Who knows it might have shaken a few things up to replay that on the evening news. Oh well ...

REPOST-FROM:mwester%waveguide.Central@Sun.COM (Mike Westerhof SE Chicago Metro)

Shuttle traffic will be rebroadcast by the 145.21 repeater... the audio
feed actually comes from the NASA select channel from one of the TV satellites.
This repeater is located around Northbrook (I think -- it isn't listed in the
repeater directory), so you may need an outside antenna to hear it at Indian
Hill (Naperville).

Also, there may be a rebroadcast of the video during the evenings on ATV.
Check 439.25Mhz or 434.25Mhz. If you have a cable-ready TV, try cable
channels 58-60, and swing your antenna around...
(ATV audio activity will be on 144.34Mhz -- you'll hear activity on this
frequency when the video is on).

good luck -- de KA9WSB

Can someone help?

Why, when I ask the proprietor of the leading local TVRO store about receiving Satellite Digital Audio, does he start talking about SCPC systems?

My real question is whether the digital audio radio station feeds are encrypted. It would be so cheap and easy to do that I would expect it to be the norm. Is it?

>and-egg scenario:

all too true.

>I don't know how it can be argued that AM stereo wouldn't make a
>difference. We just don't know. Too few people ever 1) had access to
>AM stereo in their markets and 2) had a receiver that would pick up
>the appropriate signal.

(Dr. Bruce - I hope you read this...)

here is my situation:

1) I would not buy a stereo AM radio unless the price is really low (i.e.
very little difference between an AM/FM/Cassette for the car whether
it had am stereo or mono)

2) I listen about 50/50 between am and fm when in the car. I listen
to the station which has what I want to listen to, regardless of
whether it is on am or fm. Sure, FM sounds better when you are
'close' to the transmitter, but as I drive to work the FM reception
actually gets much worse than the AM (Boulder strikes again), so
I sometimes *cannot* listen to the FM station!

April 28, 1989 to all radio amateurs - Thanks to K1XM, the Southern New
England DX Association and the Yankee Clipper Contest Club for the
following DX information.

Ocean Island. Jim, VK9NS, and Bob, KN6J, plan to operate as T33JS and
T33RA from April 30 to May 16. QSL T33JS to VK9NS and T33RA to KN6J.

Belau. JF1WQC plans to operate as KC6MJ from May 1 through 6 on all
bands. QSL to his home call.

Ogasawara. JA1NWZ and JR1QUB are expected to operate portable JD1 from
May 3 through 6, including 160 and 30 meters. QSL to their home calls.

Vanuatu. Five members of the Japan Radio Company are expected to be
active /YJ0 May 2 through 8. QSL to home calls.

Peter and Paul Rocks. The Peter and Paul Rocks expedition is currently
scheduled for May 7 through 10.

Mozambique. C9MKT operations are scheduled for May 12 through 14 and
May 19 through 21. These may be their last operations if their license
is not renewed.

Nepal. Members of the Japan UNICEF Ham Club are hoping to operate
9N9ITU May 12 through 16. QSL to JH8GAB.

Johnston Island. KN0E/KH3 has been very active, especially on 20 meter CW.

We bought a Larsen glass mount antenna about 6 months ago. Included with it was an amendment to the instructions giving very specific instructions on cleaning the window. The ones above are about what I remember. They recommended what abrasive to use, I think Bon Ami was one.

I installed the antenna according to instructions on a side window of our van and the match is very good, less than 1.3:1 everywhere I checked. Perhaps we were just lucky.

593. Need copy of _200 Meters and Down_

595. Portable tower needed

Newsgroup: rec.ham-radio
Date: 1989-04-28 12:49:26 UTC
From: so-luru@stekt.oulu.fi
Message-ID: <SO-LURU.89Apr28144926@stekt.oulu.fi>
Source record: 18838

The local amateur radio emergency service would like to know, if there is
A PORTABLE TOWER available, which could easily be moved around on a trailer.
The height of the tower would preferably be approximately 15 - 20 meters
(50 - 65 feet), and it would be easily assembled "on the road" by 3 or 4
people.

Any suggestions would be of great interest. The commercial solutions here
in Finland, at least, would definitely be too expensive. If anyone has
blueprints and / or experience of building such a (crank-up) tower, we
would be grateful of an answer!

The tower would be used for a portable repeater for emergency use, so
no 5-el 20 meter yagis needed, just plain VHF antennas..

SUBJECT: BAT-Radar.

I have listened to bat-radar in the past using a similar trick to the 'down-converter' described previously - a signal generator running at about 30KHz feeding a MC1496 balanced mixer, and using a range of different devices for receiving the bats on (piezo tweeter, several ex-TV-remote-control ultrasonic transducers etc). Putting the output through a tunable active filter swept by a scope timebase gives a crude panoramic-adaptor type display of bat activity, however some odd peaks showed up - i could detect my neighbours TV remote controller being used, and some sounds (rotary lawnmower for example) clearly had a lot of ultrasonic components.

Bat-radar does raise some, to me, interesting questions::

1) Is there a limited amount of spectrum-space for the bats to operate in?
2) If they use swept frequency techniques, how do they stop jamming each other when in a flock?
When I was at college, although such things as bat-radar were mentioned, they, together with whales, seals and electric-fishes were covered in a period of 40 minutes, and in poor detail.
Has anyone thought of dangling electrodes into a tank with electric eels in, to measure thevoltage differences they generate? Similarly, what about underwater acoustic navigation of whales, porpoises etc - their clicks and whistles must be rich in ultrasonic components. How do they stop jamming each other. Theres only ONE spectrum!
Undoubtedly using different frequencies allows the balancing of range and resolution (high frequencies for high resolution at short range, lower frequencies for long-range low-resolution operation).
They can also change repetition-frequency and could use a primitive form of interlace or windowing (several bursts transmitted before the echo from the first burst is received back).

Since they can use active techniques (change frequency as they approach an object that they are interested in) maybe this accounts for the sweeping of frequencies that people have heard. I confess to knowing little about such techniques - may be it would be worth further study for military or civil radar.
OK they use an 'active' radar where they generate the signal and listen to the echoes - i wonder if it would be possible for an individual bat in a flock (is flock the correct collective term?) to use the pulses sent by his buddies as the signal-sources for a passive system (just listen to the reverberations and echoes of the cave?)

Finally, was anyone aware that certain species of moths also use ultrasonics to defeat the bats? I cant remember the moth species

but one of them can force air down its proboscis (the coiled tongue that they use to suck up nectar) and this generates a broad spectrum of ultrasonic whitenoise, enough to confuse the bat. The moth then folds its wings and drops, hopefully out of range of the bat!
Seems like Nature beat us to the electronic warfare stage by a few millions of years.
Pete L.

Sorry to use the net, but I can't find an address for Bill that my system understands.

Bill, I used the home power to tune the antenna for the expected operating frequency. Then I place electrical tape at the joints so I can put the antenna back to the same physical dimensions without tape measures etc. Then I break it into 3 parts for transportation. Reassemble it at the location and stay near that frequency. If there is 110 available, I carry the controller. The last time I was suprized by 110 and had a real enjoyable weekend. If you plan to only use the antenna portable where the motor box can be easily reached, it is easy to replace the motor with a rod and knob extending down through the bottom of the box that will allow you to tune it by hand easily. Do note, there are no replacements for the motor. They were a special unit and Cushcraft has none left. Mine got fried by lightning and I had to improvise with a 110v motor that can 't reverse. It works, but its a pain.

I have the older R3, and someone computed the feed point impediance from the matching network components to be between 1500 and 2K ohms. I no longer have the reference to that. The value seems reasonable given the size of the tuning capacitor.

```
-------
I have a need for info on the Japanese time/frequency station JJY.
Specifically I need info on the pulses it sends out for time
ticks, and the hourly schedule (I assume it has "programming" like
WWV at different times each hour). How long are the pulses, what
frequency, is there a family of them, etc?

Have all this info for WWV, but not sure where to turn for JJY.

Thanks in advance--Jim, K6ZH, ARPANET: PRICE@NOSC.MIL

Jim,
JJY Tokyo broadcasts on 2.5, 5, 10 and 15 MHz interrupted (no emission) 25-34 minutes each hour. Announcements every 15 minutes (0, 15, 30, &45 minutes past the hour). Pulses of 8 cycles of 1600 Hz tone. First pulse in each minute is preceded by 655 ms of 600 Hz tone. There ia a 1000 Hz tone modulation between minutes 0-10, 20-25, 34-35, 40-50 and 59-60, but is interrupted for 40 ms before and after each second's pulse. Call sign and time (JST) in Morse and voice. Radio propagation forecast in letter code: N=normal, U=unstable, and W= warning or disturbance. Transmitter Long 35 D 42 M North, Lat 139D 31M E. Carrier 2 kW. Accuracy is 0.5X10 to the 10th.
This info is a few years old, but I assume it is still correct.
Good luck,
Don

I recently acquired a Radio-Shack pro-34 hand held scanner.
It seems to do the things its suppoes topretty well.
General coverage to 900+ mhz but with lots of dead bands,
i.e. not accessable via the keyboard.

A while back I head of a keyboard method to defeat the
band lockout mechanism that would allow you to program
any frequency for another scanner.

Does anyone have either key sequence or a hardware modification
instructions to allow full coverage on the pro 34?

any information would be greatly appreciated.

=======> WA3NAN will broadcast STS-30 on 7183Khz(LSB) <=========
(they have a morse given ID perodically, and a voice message ID, tune in the station and wait. (There is more to do than play with communications!))

I have just logged WA3NAN in 7183 Khz(LSB) from New York City. WA3NAN is the club station of the Godard Amature Radio Club (located in Greenbelt, Maryland) which in the past has given monitors a great service by broadcasting the Air to Ground communications for Shuttle missions. The recorded message says that they will be providing the same service for mission 30 of the Space Shuttle (STS-30), which is due to launch in about and hour and a half. If WA3NAN works this mission like it has in the past, they will re-broadcast NASA live during the day, and will work some Ham traffic after dropping the feed at night. The Ham chatter after the feed drops is also quite interesting. This station should be active all weekend (assuming things work as they have in the past).

What frequency did they have you tune your camera to?
Did it come in clearly.

This reminds me that years ago I used to travel with a lead-shield bag for
my camera. About half the time, the X-ray folks would ask me what was in
my carry-on. When I said "a lead-shield bag", they would almost invariably
let me go without asking to see inside it!.The rest of the time, they didn't
even ask.

Now admittedly, this was before the recent publicitly regarding explosives
hidden in electronic equipment.

While you are waiting for Main Engine I to be fixed, here are some
useful space shuttle frequencies.

SPACE SHUTTLE DOWNLINK (Primary) : 296.8 MHz (Shuttle must be overheard)
SPACE SUIT RADIO: 279 Mhz

(This may not be used if the infrared communication system is. Two
reasons for the IR communication system:

1. The USSR, and for that matter any other investigative agency
will not be able to tune in (or will they?)
2. The radios cannot reach all parts of the shuttle.
The new communication system takes care of that.

[A lot of very sound advice on high powere tubes/amps deleted]

One additional consideration, at least for a club station, if you DROP a
3-500Z it is extremely dangerous. You MUST wear face/eye protection while
handling them to protect against this possibility. You also need to be
careful to lay/store them properly.

The newer ceramic tubes will simply short out or crack the ceramic if abused,
expensive but much better than 20-30 sq in of broken glass flying around!
(Those suckers are BIG!)

If you ever see European (PAL/UHF) TV together with NTSC/VHF you will
be GLAD the FCC isn't trying to be that "sophisticated" any more!

Is it true that NTSC REALLY stands for Never The Same Color ? :-)

I will admit that having 90% of the broadcasting owned by governments helped,
but that is still no reason to be stuck with something as bad as NTSC AND
VHF!

Anyone have any suggestions for the best way to get a QSL card from JT1T? I know it's via JT1KAA, the club station in Mongolia. A note in QRZ-DX (DX mag) last November says IRCs are useless in Mongolia (this is attributed to JT1BG, who ought to know), and says dollars are OK, but in the Nov 88 QST there is mention of the Mongolian equivalent of the WAC award and it says "send [QSL] list with 3 IRCs to" the awards manager in JT. Duh?

I sent a card via JT1KAA with dollars last Nov, nothing received yet. Has anyone had any luck getting a card from JT1T or JT1KAA? A then-local DXer thought he got a card from JT1T through the bureau but wasn't sure (I guess *real* DXers aren't quite sure how many Mongolian cards they have, how they got them, which bands they were for - maybe they get cards from JT every day and never reply to them as there are so many...).

Incidentally, if you are after Zone 23 for WAZ, a better bet than JT1T is to work RV0YF (Tuva - counts as 23); he has a very efficient manager (RB7GG). Finally, are any of the DX mags bold enough to print lists of DX stations who never reply to QSLs? It would sure save the rest of us time, IRCs and postage to know this in advance. I have my own list, but won't include it in case it's grounds for libel...

Source record: 18836

I agree, the LM317 and the power transistor with the Zener on the base
will work well. The drawback with the transistor circuit is that if
the transistor shorts, you have the unregulated input voltage on the output.

When I use the transistor circuit, I use NPN power Darlingtons and
also place a low value tantylum electrolytic across the Zener.

I have also used the 3-Terminal regulators. A word of caution here...

You need to drop 2.6 volts min. across the 7812 regulator. That means that
your input voltage (from the car) must be at least 14.6 volts (not usually
available from the battery). This is the "Vin rating" specified in the
National databook. Actually, they spec. the part with 19 volts input.
It does work with lower input voltages however (or else the circuit I use
wouldn't work).

Also, the 78xx regulators are only rated for 1 amp. output. The LM317
is rated at 1.5 Amps.

I have used the 3 terminal regulators with my Yaesu FT209RH at 5 watts output.
They do get rather warm when rag chewing. A heat sink solves the problem,
however.

All in all, the LM317 circuit mentioned in the previous posting is the best,
I believe. It doesn't present the input voltage "gotcha", it has a higher
current rating, is adjustable, and only requires 4 external components
to do the job. Just make sure you mount it to a heat sink or a chunk
of sheet aluminum (could be the box you put it in).

The databook I have (TI) doesn't say what the metal tab on the regulator
is connected to but my guess is that it is the regulator output. I would
play it safe and electrically isolate the metal tab from the heat sink
using an insulating washer and hardware just in case the heatsink comes
in contact with any (grounded) metal in your car. You could cause big
problems grounding something inadvertantly. Radio Shack has all of the
stuff and I believe the regulator schematic is on the back of the card for
the LM317.

Tradeoffs, tradeoffs, tradeoffs....

Barry - WB6JZL

616. bat radio and how they share the spectrum - a speculation

Newsgroup: rec.ham-radio
Date: 1989-04-29 17:36:28 UTC
From: kawai@csli.Stanford.EDU
Message-ID: <8740@csli.Stanford.EDU>
Source record: 18843

Peter Morgan Lucas, Network Support, Swindon, writes:
>Bat-radar does raise some, to me, interesting questions::
>1) Is there a limited amount of spectrum-space for the bats to operate in?
I would assume so. Not only due to the physical limit on the size of the glottis, but also due to the physical limit on the length of the organ of corti. One reason we humans can only hear up to 30,000 Hz (and that's at normal birth - as we age, it drops to about 18,000 Hz, even lower) is because our ears, specifically the long organ within the cochlea which is lined with hair cells, has a finite length. One end is tuned to the low end of our receptive frequency range, and the other, the highest.

>2) If they use swept frequency techniques, how do they stop jamming each
> other when in a flock?
I know very little about bat communication; however, from observations made on the communications of other species, including man, I speculate the following. First, bats probably have different voices across individuals. One reason why we can identify who is talking in a big party is because we have different voices, which is partly a result of the differences in our physique. Individual voice differences have been noted in many species. You can probably recognize your favorite dog's bark from your neighbor's, for example. The second issue is that of language difference across species. There is most likely a difference of how bats chirp across species, at least partially based on their systematic physical differences. A third issue is that of dialectal differences among groups which belong to the same species. This has been observed for some non-human animals. The Canary Islands is not only famous as a DX country, but also as having a separate canary song for each of its islands. You may know that canary breeders put a young chick's cage close to a mature, comptent singer's cage, to make the novice learn how to sing (or send the code, perhaps). Wild parrots and macaws have dialects, and also seasonal songs -- if you ever wondered what wild parrots imitate, well, they imitate other parrots, creating a regional pattern of parrot calls! Bats are known to stick to the same flock (which can grow to be quite large). Perhaps they accomplish this by recoginizing the flock's dialect.

>Has anyone thought of dangling electrodes into a tank with electric eels
>in, to measure the voltage differences they generate?
Yes. The voltage and current output is quite impressive, especially since some electric eels can grow over 2 meters long. This would make them an ideal emergency power source for power not derived from commercial mains on field day. They seem to use a weak electric field as a sensory mechanism, and use it for naviation and for finding food (they are carnivorous). When they find their prey, they zap it. The mating behaviour of electric eels is not known. You wouldn't really be popular if you keep zapping your

potential girlfriend every time she walks through the door! For more info,
cross post to alt.aquaria, to which I also subscribe.

>Similarly, what
>about underwater acoustic navigation of whales, porpoises etc - their
>clicks and whistles must be rich in ultrasonic components. How
>do they stop jamming each other. Theres only ONE spectrum!
Same speculation as for the bats.

>OK they use an 'active' radar where they generate the signal and
>listen to the echoes - i wonder if it would be possible for an individual
>bat in a flock (is flock the correct collective term?) to use the pulses
>sent by his buddies as the signal-sources for a passive system (just
>listen to the reverberations and echoes of the cave?)
Wouldn't be surprised at all if this were the case. We humans do this
to a certain extent, too. For example, say you're walking down a dim
hallway that you're unfamiliar with, and you hear voices, increasing
in amplitude, from down the corrdior, with an echoey ring to it. You might
deduce that the hallway takes a perpendicular bend somewhere in the distance,
and the people are walking towards you from that portion of the hall.
Bats are experts in the sonar business. They probably have this skill as
an innate capability, hard-wired into them.

>Finally, was anyone aware that certain species of moths also use
>ultrasonics to defeat the bats? I cant remember the moth species
Wow, the wonders of nature never fail to impress and humble me. Human
language alone is complex -- and I study only the audio portion of it.

>goh<
ps: i saw the preview of "batman - the movie". the batmobile looked
different, and i didn't recognize it at first. ah well,,,

I found a CD/Album that has a lot of morse code in it:

RADIO K.A.O.S. - Roger Waters - Columbia Records - CK 40795

Standard Disclaimer: I have no affiliation with Roger Waters, CBS Inc, or
Columbia Records.

In article <8740@csli.Stanford.EDU> kawai@csli.stanford.edu (Goh Kawai) writes:
>>Has anyone thought of dangling electrodes into a tank with electric eels
>>in, to measure the voltage differences they generate?
>on field day. They seem to use a weak electric field as a sensory mechanism,
>and use it for naviation and for finding food (they are carnivorous). When

I heard a talk some years ago on some species of electric fish that use electric pulses only for sensory purposes; they lack the ability to zap the prey. I'm trying to think of the name of the fish - something about sternarchus, and the only other word I can think of is gymnopediae, which of course is the title of the famous Erik Satie pieces for piano, not the name of a fish. Anyway the lecturer stuck a couple of wires into the tank and played what he got through an amplifier and loudspeaker. I always thought it would be interesting to have one of these fish and put various patterns of electrodes in the tank and pulse them and see how the fish responded.

In article <8904281524.AA19721@marlin.nosc.mil> price@MARLIN.NOSC.MIL (James N. Price) writes:
->I have a need for info on the Japanese time/frequency station JJY.
->Specifically I need info on the pulses it sends out for time
->ticks, and the hourly schedule (I assume it has "programming" like
->WWV at different times each hour). How long are the pulses, what
->frequency, is there a family of them, etc?

Here is the information that I have on JJY:

Seconds pulses: 8 cycles of 1600Hz and 1000Hz tones

During seconds 0-15 of each minute, code of DUT1, consisting of 45-ms tones of 1600Hz. (I have no idea what this means)

Also, every 10 minutes the station identifies as follows:
Callsign in CW (*2)
Time in JST (Japan time) in CW
Callsign in voice (*2)
"Grade of propagation" warning in CW

The address is:
Communications Research Laboratory
2-1 Nukui-Kitamachi 4-chome
Koganei-shi, Tokyo 184
Japan

This info is basically the same as what is in the WRTH for 1989, on page 54.

Hope that helps some...

One idea I had for interference suppression of multiple bat echos, would be that each bats echo would be synchronous while other bats echos would not. The same technique used in TACAN DME. 100 aircraft can use a TACAN on the same frequency because they only synchronize with themselves.

621. ICOM 735S Mods ...

Newsgroup: rec.ham-radio

Well. Thanks for all the help. I've finally made our new ICOMs RECEIVE
on all bands, but can't get them to transmit UNLESS they're in
the HAM Bands. For most of us, this is great! For those of
us that have to work outside of the bands, it's not so good.

I've been told there is a 'sequencer re-initializing' that must be done...
Any ideas on how to do this?

The mod made was that D33 and D34 were to be disconnected. (Done.)

Any assist will be appreciated.

622. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1989-04-30 15:25:51 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <8905010703.AA07277@ucbvax.Berkeley.EDU>
Source record: 18849

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

623. NASA Prediction Bulletin Format

Newsgroup: rec.ham-radio
Date: 1989-04-30 15:26:28 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <8905010702.AA07261@ucbvax.Berkeley.EDU>
Source record: 18850

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

```
Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)
```

```
Line 3
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
```

09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

Note that the International Designator fields are usually blank, as issued in
the NASA Prediction Bulletins.

SpaceNews

MONDAY MAY 1, 1989

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly
on packet radio bulletin board systems and the Unix USENET news network.
It is available around the world on many computer news systems and is available
for unlimited distribution.

* MIR NEWS *

A problem in the electrical power subsystem on the Soviet MIR space station
has made it necessary for the crew of MIR to leave the station and return to
earth. Before their return to earth, Cosmonauts Alexander Volkov, Serge
Krikalev and Valeriy Polyakov placed MIR in a 500 km circular "parking" orbit
that will remain until a repair crew is sent to MIR in the next few months.

U4MIR/U5MIR Amateur Radio operations from MIR have ceased. Operations were
reported as late as 23Apr89 on 145.550 MHz. Many stations in Europe reported
hearing air-to-ground communications from MIR on 121.750 MHz shorthly before
the Cosmonauts left MIR on 27Apr89.

* OSCAR-9 NEWS *

Diary software reloads will take place on Tuesdays and following this, a CCD
image will be transmitted. The time the image is taken will depend on earth
illumination. During the Northern hemisphere winter months, this will either
be Tuesday or Wednesday mornings, UTC. The CCD image will be transmitted until
00:00 UTC on Thursday, when the beacon will switch to Digitalker telemetry.

* OSCAR-10 NEWS *

ALL amateurs are requested NOT to use AO-10 for the next two months.

* OSCAR-11 NEWS *

OSCAR-11's Digitalker is back in operation after several weeks of silence.
FAD-1 Forth Applied Diary operating system version 2.0 is currently in
operation on OSCAR-11.

* OSCAR-12 NEWS *

The latest operating schedule for Fuji-OSCAR-12 is as follows:

Date Mode Operating Period
------+------+-------------------
29May : JA : 1500 - 0754 30May
03Jun : JA : 0715 - 1526
06Jun : JA : 1446 - 0540
09Jun : JA : 0553 - 1405

Note that only the mode J analog transponder will be in operation during these times.

* OSCAR-13 NEWS *

The following operating schedule for AO-13 is expected to remain in effect until 03May89:

Mode : Beginning (MA)
------+---------------
B : 100...160
JL : 160...200
B : 200...255
OFF : 000...100

* SHUTTLE NEWS *

The launch of ATLANTIS was halted 31 seconds before lift-off on 28Apr when the shuttle's on-board computers sensed a malfunction in a pump on the orbiter. Repairs are underway to fix the pump and repair a leaking fuel line.

The launch of STS-30 will be delayed at least until Thursday, this week. The astronauts for this mission have either returned to Houston or gone home while they wait for the problemswith the shuttle to be corrected.

The Magellan space probe must be launched before May 29th, or suffer a two year delay in launch, so that the Earth and Venus will be in the proper attitude so Magellan can achieve an orbit insertion with Venus.

STS-30 TRAJECTORY SEQUENCE OF EVENTS:

** UoSAT-OSCAR-9 Operations **

The UoSAT-Oscar-9 schedule is as follows:-

Diary software reload will take place on Tuesdays, and following this
a CCD image will be transmitted. The time this image is taken will depend
on illumination, but during the Northern Hemisphere winter months this will
be either Tuesday or Wednesday mornings (UTC). The CCD image will be
transmitted until 00:00 UTC on Thursday, when the beacon will switch to
```

digitalker telemetry. The channels are:-

8 Battery Pack A Temperature (C)
9 Spacecraft +X facet temperature (C)
17 Magnetometer Experiment - Hz Fine
18 Battery Pack B Temperature (C)
19 Spacecraft -X facet temperature (C)
27 Telecommand Receiver Current (mA)
28 Radiation Experiment Temperature (C)
29 Spacecraft -Y facet temperature (C)

From Thursday evening (UTC), the spacecraft will transmit the following sequence of data at 1200 bits/s.

Telemetry - 60 seconds
Bulletin - 60 seconds
Whole Orbit Data (WOD) - 150 seconds

This will continue until 00:00 on the following Tuesday, when the beacon will switch off ready for software reload. The WOD channel are currently as follows:-

Thursday 22,23,30
Friday 3,13
Saturday 3,13
Sunday 1,3,13
Monday 1,23,49

Please use Bulletin ID UOSAT.259A if put on a packet radio BBS.

> Pete L.

I was aware that the wax moth could detect bat-radar. The wax moth is a moth that eats beeswax. It is found wherever bees and their products are found. It is an elusive beastie, but can be found in many apiaries, despite what the bee keeper says.

A few years ago, I attended a lecture by an entomologist from UCLA. He specialised in wax moths. I kept bees at the time so was interested in knowing a bit about the moths. He mentioned that if the moth was out in the open and detected bat squeeks it darted for cover. As this was a lecture at a bee club, he didn't dwell too much on this. I have forgotten his name, but could ask around at UCLA.

As an interesting sidenote, he fed his wax moth pupae not on bee combs but a mixture of other stuff, mainly brewer's yeast.

Yours

627. Kenwood TH-25AT

Newsgroup: rec.ham-radio
Date: 1989-04-30 21:46:38 UTC
From: asplund@castor.usc.edu
Message-ID: <3682@nunki.usc.edu>
Source record: 18846
Cross-posted to: rec.ham-radio,sci.electronics

A friend of mine just purchased a Kenwood TH-25AT. Upon
reading it's review in "'73 Amateur Radio", he asked me if
I would post on the net asking if anyone knows the MARS AND
CAP modification(s). So how about it? Anyone?

Thanks for the help in advance!

Please send all responses to me directly: Asplund@castor.usc.edu,
and I will promptly pass them along.

Thanks again,
Daryl

:: SWEDEN CALLING DXERS ::
:: from Radio Sweden ::
:: Number 2040--April 25, 1989 ::
::::::::::::::::::::::::::::::::::

Shortwave and other electronic media news from Radio Sweden.

This week's bulletin was written by Agnes Carbon.

Electronic Edition edited by George Wood.

Packet Radio BID SCDX2040

---------------------------------------------------------------------------

NOTE--Next week's Electronic Edition will be delayed, as I'll be in Leningrad
on my honeymoon. Hopefully you should see two editions in two week's time.
(George Wood)

SATELLITE-RADIO--Europe can look forward to a brand-new satellite-radio
service, called Super Gold-The Oldies channel. It's to begin broadcasts from
an Intelsat satellite on July 1st. Besides cable networks, the new service
will probably be picked up by Independent Local Radio stations in Britain.
(Bradley Allen, England)

SATELLITE-TV--We've reported before how the Scandinavian satellite-TV channel
TV3 won the rights to broadcast the ice hockey world championships, which are
going on now here in Stockholm. Now the newspaper "Dagens Nyheter" has
discovered how people with satellite-TV reception equipment can tune in on
the broadcasts, without having to buy decoders, which aren't on the market
anyway, and without having to watch all the commercials.

TV3 itself broadcasts from the Astra satellite. But the signal is being
relayed from Stockholm to TV3's headquarters in London using ECS-2, also
called Eutselsat F2. Anyone who tunes in there can watch the hockey, without
commercials, and even apparently watch the crew clowning around before the
broadcasts. ("Dagens Nyheter")

ALBANIA--Radio Tirana uses now only two SW frequencies for its half hour
German broadcasts: 7310 and 9373 kHz (along with MW 1458 kHz evenings). The
times are 04:00, 12:30, 14:00, 16:00, 19:30 and 21:00. (Wolfgang Gruschel,
West Germany)
```

AUSTRALIA--Updating SCDX-2039, Radio Moscow has stopped interfering with Radio Australia on 9655 kHz at 07:00-10:30. Reception is still bad Sundays until 08:55 because Radio Sofia uses the frequency for Serbo-Croatian and Greek. (Volker Wachtendorf, West Germany)

AUSTRIA--RAI's DX show in German "Kurzwellen-Panorama" is to be broadcast Saturdays at 05:05, 08:05, 11:05, 14:05, 17:05 and 20:05 on 6155 kHz (13730 kHz at 05:05, 08:05 and 11:05). (Helmut Zastrow, West Germany)

AUSTRIA/CHINA--A delegation from Radio Austria International went to China on the invitation of Radio Beijing and the Chinese government to inspect transmitter and relay station sites for a possible exchange of broadcasting hours and relay co-operation agreement. Austria is especially interested in improving reception of shortwave programmes from Vienna in the South East Asian and Pacific regions. Radio Beijing has already concluded relay agreements with Switzerland, Canada, Mali and Spain. (BBC Monitoring)

BELGIUM--BRT has added the new frequency of 9925 kHz for its morning program in German weekdays 08:30-08:55. 6035 and 11695 kHz remain in parallel. (Wolfgang Gruschel, West Germany) The national radio news bulletin in German is broadcast to Europe and Africa over RTBF at 10:30-10:45 on 9925 and 25645 kHz. (Wolfgang Gruschel, West Germany)

BURUNDI--Radio Burundi has been heard testing on 6190 kHz at 17:00. (Marcel Rommerts, Netherlands)

CUBA--Since March 27th, the Havana tourist radio station Radio Taino has announced only 1160 kHz. 830 kHz is no longer announced or observed, though the station continues to use an additional unannounced transmitter on 1040 kHz irregularly. (BBC Monitoring)

FRANCE/GABON--According to an observation made on April 8 at 19:35, Radio France International has changed its frequency from Gabon from 4890 to 4860 kHz. Parallel frequencies were 6175, 7160 and 9760 kHz. (Gerhard A. Werdin, West Germany)

WEST GERMANY/SRI LANKA--The Deutsche Welle relay in Trincomalee will start operating again from May 1st. In German 07:00-14:00 on 21640 kHz, 17:00-18:00 on 21560 kHz, 22:00-24:00 on 11785 kHz, 10:00-14:00 and 17:00-18:00 on 1548 kHz. In English 02:00-02:50 on 1548, 9615 kHz and 11835 kHz; 09:00-09:50 on 11945 and 17875 kHz and 16:00-16:50 on 1548, 6170 and 7225 kHz. (S. Umakanthan, Sri Lanka).

HAITI--On April 6th the Haitian national guard took a number of radio stations off the air by damaging or cutting off their antennas. According to one report, people were wounded at some of the stations. At Radio Liberte soldiers are said to have totally destroyed the transmitter as well, while at Radio Antilles International palace soldiers took away transmitting equipment while a gun was held to the head of a watchman. Only four stations (the official Radio Nationale, the private Arc-en-Ciel, the Catholic Church's Radio Soleil and protestant Radio Lumiere) continued operations. (BBC Monitoring)

IRAQ--Radio Baghdad now uses 11800 kHz for its English broadcast to South Asia at 01:30-03:30, jamming the SLBC's Hindi transmission to South Asia on the same frequency. (Kanwarjit Sandhu, India and Cosimo Cannata, Italy)

ITALY--According to a QSL letter, Radio Europe in Milan broadcasts daily at 08:00-10:00; Tuesday to Friday on 27827 kHz and Saturday, Sunday and Monday on 7295 kHz. (Hans-Dieter Buschau, West Germany)

SOUTH KOREA--Radio Korea will have some new broadcasts in German from May 1 at 11:00-11:45 on 13670 kHz. The English program at 06:00 to North America will move from 6060 to 11830 kHz and Spanish at 01:45 will be beamed to Africa and the Middle East on 6165 kHz. (Herbert Aichele, West Germany)

NETHERLANDS ANTILLES--Updating SCDX-2029 TWR's DX program "Bonaire Wavelength" is aired Sundays and not Saturdays, on 9035 and 11930 kHz at 03:30. (Volker Wachtendorf, West Germany)

PAKISTAN--Updating SCDX-2039, Radio Pakistan's English slow speed new broadcasts use 21575 kHz at 11:05-11:20. (A.E. Broadsmith, England)

UNITED STATES--Greenpeace has started broadcasts in English via KUSW in Salt Lake City. The frequency is 15650 kHz and the broadcasts are Mondays and Thursdays at 18:30, Tuesdays and Fridays at 19:30, Wednesdays and Saturdays at 17:30 and Sundays at 19:15. (Henrik Karlsson, Sweden)

Updating SCDX-2038, the new Christian Science Monitor station WSHB in South Carolina is also broadcasting to Australia at 08:00-10:00 hrs on 17855 kHz. (BBC Monitoring)

The Christian Science Monitor has had to fire all but a handful of the employees working for Monitor Radio and its shortwave World Service. This is because of the financial burden of developing a daily television news program. From May 1st there will be a new consoldiated program on shortwave, run simultaneously from the transmitters in Maine, South Carolina and Saipan. (Radio Netherlands "Media Network")

USSR--Radio Vilnius in Lithuania has a new schedule in English: at 21:30-22:00 on 666 and 6100 kHz and 22:00-22:30 on 666, 6100, 7400, 9765, 9860, 15240, 15455 and 17665 kHz. On Mondays and Thursdays at 22:00, there is now a 4 minute Esperanto transmission.

VENEZUELA--Radio Mara, Maracaibo was heard from around 09:00 until 04:00 on 3275 kHz. (Franz J. Bartel, Venezuela)

ZAIRE--Radio Bukavu was heard on 4860 kHz in French at 03:40. (Hans-Dieter Buschau, West Germany)

UNOFFICIAL RADIO--A station identifying itself as Radio Siboney, the Voice of the Cuban exiles, was observed on March 5th from 17:30-18:27 on 6100.2 kHz. It is believed to be named after a Cuban popular song and addresses itself to Cuban forces in Angola. (BBC Monitoring)

Sweden Calling DXers is the world's oldest radio program for shortwave listeners. Radio Sweden has presented this round-up of radio news, features, and interviews on Tuesdays since 1948. RS broadcasts to North America:

15:30 hrs on 17880 and 21610 kHz
03:00 hrs on 9695 and 11705 kHz

To Europe, Africa, and the Middle East:

17:00 hrs on 1179, 6065, and 9615 kHz
21:00 hrs on 1179, 9655 and 11705 kHz

And to Asia and the Pacific:

12:30 hrs on 17705 and 21610 kHz
14:00 hrs on 17705 and 21610 kHz
15:30 hrs on 17705 kHz
01:00 hrs on 15390 and 17790 kHz

The Radio Sweden schedule to Europe can be found on Sky Channel's teletext Service, Sky Text, on page 496.

The Electronic Edition is based on the Sweden Calling DXers bulletins which are mailed out every 4 weeks to contributors. Contributions can be sent to DX Editor George Wood to Swedish telex 11738, CompuServe (via the HamNet Forum or Easyplex 70247,3516), through the FidoNet system to 2:501/297 or to SM0IIN at the packet radio BBS SK0TM.

Reports can also be sent to:

Radio Sweden
S-105 10 Stockholm
Sweden

Contributions should be NEWS about electronic media--from shortwave to satellites--and not loggings of information already available from sources such as the "World Radio TV Handbook". Clubs and DX publications may reprint material as long as Sweden Calling DXers and the original contributor are acknowledged, with the exception of items from BBC Monitoring, which are copyright.

We welcome comments and suggestions about the electronic edition, Sweden Calling DXers, and our programs in general.

Thanks for 45 contributors this week Good Listening!

Well, what did it say?

I remember some movie a long time ago had some morse in it, and the
message, which was totally unrelated to the plot line, was something
along the lines of "Hello ARRL, can u rd this?"

632. 32AT MIC

Newsgroup: rec.ham-radio
Date: 1989-05-01 14:46:46 UTC
From: FRANK@TOPS20.RADC.AF.MIL
Message-ID: <12490536599.9.FRANK@TOPS20.RADC.AF.MIL>
Source record: 18853

I recently purchased an Icom IC32AT (which I am very pleased with) and I would like to use it on packet. I started to wire the mic connector like that of an 02AT but I realized that my mic plug has 3 connections instead of 2. I found this strange since the mics from the 02 series are supposed to be interchangable with the 32. Can anyone shed some light on this matter and/or provide some information concerning the correct connections? Thanks.

Joe - WD2F

From: holly@hpcupt1.HP.COM
Message-ID: <7120063@hpcupt1.HP.COM>
Source record: 18855

The difference in length is due to the velocity factor of open wire verses the velocity factor of twin lead. Velocity factor is the ratio of the wave length in the cable to the wave length in free space. open wire has a velocity factor close to 1, therefore the length required will be longer.

>Bat-radar does raise some, to me, interesting questions::
>1) Is there a limited amount of spectrum-space for the bats to operate in?
>2) If they use swept frequency techniques, how do they stop jamming each
> other when in a flock?

Actually, I can answer this question since I know something about
sonar. It turns out that bats use a form of frequency modulation
called LPM (Linear Period Modulation). For such a waveform, the
instantaneous frequency is described by a hyperbolic function as
opposed to a LFM (Linear Frequency Modulation) where the instantaneous
frequency is described by a linear function.

LPM signals have the advantage of being `Doppler tolerant.' This
means that regardless of the relative motion between the transmitter
(the bat), and a target (an insect), the receiver (the bat, again)
should always be able to accurately determine the target's range.
This result can be derived from matched filter theory. Check any
elementary text on communication/detection theory.

A considerable amount of research in the area of biological sonar
was conducted throughout the 1970's. People were looking into how
bats, dolphin, seals, and whales communicate and echo-locate. Many papers
were published in the various IEEE journals, and in the Journal of the
Acoustical Society of America (JASA). In particular, you may want to
read

`Bat Signals as Optimally Doppler Tolerant Waveforms,' by Altes and
Titlebaum; JASA, Vol 48, No. 4, Part 2, pp 1024-1020, 1970.

I don't know about bats, but in one paper written by these guys a
spectrogram was shown of a call of a Weddel seal. The call was
composes of several pulses whose correlation properties were similar
to that of the LPM; Doppler tolerance. The bandwidth was on the order
of 2 kHz. I don't know if anyone solved the `cross-talk' problem.
I would assume each bat uses a signal based on a slightly different
hyperbolic function. That way he can detect on a signal that has his
own particular `signature' thereby ignoring any others.

638. Re: Kenwood TH-25AT

Newsgroup: rec.ham-radio
Date: 1989-05-01 17:20:51 UTC
From: bmp@hpcupt1.HP.COM
Message-ID: <7120064@hpcupt1.HP.COM>
Source record: 18857

Generally, If someone is authorized to transmit
on the CAP or MARS frequencies, they will carry
a permit of some form authorizing them to do so.

Mailing a copy of that permit to Kenwood's customer
service generates the instructions in the return
mail. Most dealers have Kenwood service notes
which generally contain the information as well.

**** UoSAT-OSCAR-11 BULLETIN - 182 28 April 1989 ****

UoSAT MISSION CONTROL CENTRE
University of Surrey, Guildford, Surrey, GU2 5XH, England

** UoSAT D/E update **

The structure for the new UoSAT spacecraft is being machined now,
using the CNC (Computer Numerically Controlled) equipment from the
University of Surrey's department of Mechanical Engineering. The finished
structure will be taken to Toulouse in France soon for a fit check with
the ASAP launcher attach fitting (The Ariane Structure for Auxiliary Pay-
loads).Much work is being done on thermally modelling the spacecraft, in order to
prevent the electronics from too large variations in temperature, which will
increase the lifetime of the spacecraft. The first solar panels have
undergone thermal cycle tests, and are now being fitted with gallium arsenide
cells, which will give 17.5 percent efficiency.

** UoSAT-OSCAR-9 **

The latest UoSAT-OSCAR-9 element set from RGO is :-

EPOC 110.59731736
INCL 97.5639
RAAN 160.8197
ECCN 0.0001652
ARGP 317.6533
MA 42.4416

MM 15.52508353
DECY .00074654
REVN 42003

* UoSAT-OSCAR-9 Decay Competition

The competition is as follows: Using any method you choose, predict the
precise day (UTC) on which UoSAT-1 will decay completely.
Your entry must arrive at least four weeks before the date of your prediction.
Please include the following information:

Name:
Occupation:
Address:
Receiving Equipment:
Predicted Decay Date:
Method Used:
Sweatshirt Size (L/M/S):

The address for entries to the competition is:-

'UoSAT-1 Orbital Decay Competition'
AMSAT-UK
94 Herongate Road,
Wanstead Park,
LONDON E12 5EQ, UK.

** OSCAR-13 **

* Operating Schedule until May 3, 1989 *

Mode B MA 100-160
Mode JL MA 160-200
Mode B MA 200-255
OFF MA 0-100

Many AO-13 users are unaware that there is an AMSAT Operations Net
which is conducted on AO-13 several times each month to help answerquestions about OSCAR satellites and to provide information about the
things going on in AMSAT. The following is a list of the times for the
Ops Net:-

Date UTC

29 Apr 1700
07 May 0300
14 May 0400
21 May 0200
28 May 0200
04 Jun 0300
11 Jun 0000
18 Jun 0100
25 Jun 0300

Nets can be held on B or JL, but may be rescheduled due to "off" periods.
Frequencies are 145.950 MHz up and 435.970 MHz up. All these are for AO-13,
but AO-10 is sometimes used, when available.

(De ANS)

** FUJI-OSCAR-12 **

Date Mode Operating Period

29 May JA 1500 - 0754 30May
03 Jun JA 0715 - 1526
06 JA 1446 - 0540
09 JA 0553 - 1405

>
>from INSIDE, first with a 1/8" drill, then with a 3/8". If your
>antenna needs a larger hole (like 5/8"), use a chassis punch,
>antenna drill, or a tapered reamer.
>

If you must drill from the outside, a friend added this warning:
When using an antenna drill (basically a metal cutting hole saw/drill)
proceed very slowly and stop to allow things to cool before making
the final cut through. The small circle of metal removed by the
drill is likely to be very hot. If it drops from the drill, and
into the car, it lands on the top side of the car's headliner. It
can (my friend claims the voice of experience!) melt through, making
an awfull mess!

The antenna drills I have seen had a magnet built in to catch the
"hole". What I do is this: go to a commercial dealer/installer. I
buy the mount from him and have my car ready for the hole. He walks
out with his cordless drill and presto, a hole.

Hope this helps..

>want that? I don't. As Mike Waters has said, that kind of thing is even
>more damaging.

Last night there was quite a "war" on my favorite frequency (14.010),
caused by a rather large number of people interested in working a JY9.
And an even bigger one at 14.198 surrounding a YI2. Yet I heard no
malicious interference, just a lot of people playing the game. I did
however hear quite a bit of malicious interference on 3.895, with
fewer than a half-dozen operators trying to carry on a silly
conversation (about par for that band).

I don't want malicious interference, but we have separate rules about
it. Nonmalicious "interference", the inevitable result of sharing
frequencies, is at the heart of ham radio.

>>Co-channeling repeaters where they are warned that they have some
>>overlapping coverage is not the same as putting two open repeaters
>>five miles apart on the same pair. Commercial users have gone
>>to PL, anti-PL, etc.; these techniques work, especially when the
>>primary coverage areas differ but secondary areas overlap.
>
>These techniques may work in the commercial world, but there is no
>covenant there. There is one in the amateur coordination field. We can't
>unilaterally overturn that covenant.

Covenant? Interesting term. Is that as in a deed restriction, or
as in what in Hebrew (Ashkenazic) is called "bris"? Sorry, but my
ham license disclaims frequency ownership.

>The semi-idle repeaters have made an agreement: they put up (to a
>certain extent) with us telling then where they should operate, and
>within what technical parameters, and we protect them. We can't
>unilaterally change that, and that's exactly what you're calling for.

Yes, you can unilaterally change that! Conditions change, and
the terms of grant change. How do you think the clear channel AM
broadcasters felt when the FCC loosened up the AM rules? The AMST
complained but the frequencies are the public's, and the FCC is
exercising judgement over what is the current best way to use them.

>During the 20 kHz discussions, this was a common thread: "They use
>upright 15 kHz channels in the Northeast, why can't we here?"
>People who had operated there, and who had moved here, were unanimous:
>repeaters there were much less usable than they are here. Lots of
>interference, and lots of arguments, and lots of adjacent-channel
>problems. The users and trustees of Texas repeaters decided they didn't
>want that.

That doesn't really relate to abolishing Gosrepeater coordination.
The bandplan and the allocation of channels are two different
issues. I rather like the inverse-split 15 kHz (California) plan,
but we don't really have problems with the 15 kHz plan here any
more; we're used to it.

Sure, it was a pain at first, but we chose our frequencies more
carefully, use tighter crystal filters, etc. Basically, we decided
as a whole that the 1971-vintage radios weren't adequate any more.
Sort of like the way we stopped running AM at 14.210.

642. Yaesu 470R Dual Band--WOW!!

Newsgroup: rec.ham-radio
Date: 1989-05-01 18:13:00 UTC
From: ppddc@uwocc1.uwo.ca
Message-ID: <0610035959@uwovax.uwo.ca>
Source record: 18864

Anyone who didn't make it to Dayton should be sure to check out Yaesu's new dual band radio. 42 memories, 14 mem/sec scan rate, different scan types, built in encode/decode, 10 autodial memories, dual vfo's, dual priority--the list goes on...all for less than $500 US. A close friend bought one and loves it.

Here is the code to extend VHF receive coverage to 130-180 mhz:

1. TURN RADIO OFF.
2. PRESS BOTH UP AND DOWN ARROWS.
3. TURN RADIO ON.

From first indications, this is receive only and UHF is unchanged. If anyone finds any more codes, please email direct. (I'm going to have one within a couple weeks, I hope.)

By the way, my hat is off to the guys at the Yaesu booth. I dropped over $100 on the floor and the took the time to ensure it got back to its rightful owner even though there was no name or address with it. It sure was nice to see such honesty and helpfulness. They could have easily pocketed the money and saved the time and effort of tracking me down.

644. MORE ON PRO2020 SCANNER MOD.

Newsgroup: rec.ham-radio
Date: 1989-05-01 19:31:30 UTC
From: MKELLY@CARLETON.CA
Message-ID: <890501.14322118.027181@ADMIN.CP6>
Source record: 18866

Somebody asked me to post a note saying how I developped the mod to
the Pro 2020 scanner that I posted a while ago, and a written description
of it..... so here it is:
I started thinking about the addition of more memory while repairing the
radio in late 1987 (cpu failure.. 2 addr. lines shorted together inside
the dip). I figured all I had to do was buy another ram or two like is
in there already, solder them piggyback style on top of the original one,
pull out the CE1 lines and bring them to a front panel rotary switch or
equivalent.
It seemed the ram chip was no longer available. After paying fourty bux Canadian
for
the (mask programmed) cpu from radio shack, I wasn't even going to ask
them about the ram. The project went dormant for a bit over a year. A
few weeks ago, I decided that my "next scanner" (the apparantly mythical
AOR 3000) wasn't going to get out of the "vapourware" stage before the
coming motor racing season.
I figured I'd better get to work on updating what I have.
After much time with catalogues and the schematic, I decided the way to
go was to haul out the old memory, put in one with more room in it, and
put a switch or counter on the extra address lines that a bigger ram
must have. Then I realised that the existing ram used a second chip
select to hold the ram out of the picture until the cpu is fully awake.
It occurred to me that if I wanted to, I could keep the original ram
and just select between the two with a mux, using the old ram CE2 line to
keep the new ram from being selected during power_on_reset. I decided on
a counter to go onto the new high order address lines so that if it
actually worked, maybe I could get it to count up after every cycle.
I found a FND 357 seven segment led in the junk box, so I
decided to add it to the counter output lines. After I installed it, I
noticed that there is a high efficiency version, the FND 367 available,
so I bought one of those and put it in. I also got
a 500 Khz ceramic resonator to replace the original 400Khz one.
I figured that if I can get a 25% speedup with no penalty
except a wallet lighter by a two dollar bill, why not?
SO... the current status is:
CE1 from the cpu goes to the input to a 1 to 2 mux (1 input, CE1;
2 outputs, OLD_CE1, NEW_CE1).
The mux is made of 1/2 of a 74hc00 2 input nand and 2/3 of a 74hc10
3 input nand. There is one 3 in nand unused, inputs are tied high.
The 3input nands drive the ce lines on the rams. The third input on
each of the two 3 in nands is driven by the power_on_reset line that
goes to CE2 of the ram in the original machine. This signal stays
low until the rest of the system is powered up and stable, preventing
spurious chip selects (& writes) until the power up sequence is complete.

The top 2 address lines of the new ram (1k x 4 cmos) are selected by a 4520 4 bit binary counter configured to count 0,1,2,3,4 with binary output 101 decoded with another 1/4 of the 74hc00 looking for a high on Q0 and Q2 of the counter at the same time. This signal is inverted (using the last 1/4 of the 74hc00) and fed into the clear line of the counter. The clock inputs are configured so a low on the clock will increase the count. The line(s) being used for the clock have a resistor to counter vcc and a capacitor to ground. The bank select switch is a SPST N.O. switch that shorts the capacitor.
Q2 goes to the select input of the mux. When Q2 is low, chip selects from the cpu go thru to the new ram, and when it is high, the chip selects go to the original ram, as before, like this:
Q0 Q1 Q2
0 0 0 new ram bank 00 bank display reads 0
1 0 0 new ram bank 01 bank display reads 1
0 1 0 new ram bank 10 bank display reads 2
1 1 0 new ram bank 11 bank display reads 3
0 0 1 old ram (only one bank) bank display reads 4
1 0 1 generate asynch reset and go back to 0 0 0
The bank display
is a FND367 using 470 ohm resistors to +5v. The display driver is a 4511 driven off the SECOND counter in the 4520 package. Since one of the segments in a 0-1-2-3-4 counter is always on, it is run (via its resistor) directly off +5, rather than off of the 4511.
I used rather stiff decoupling (around 100uF in parallel with .1uF) on the display "module" (4511+fnd367), and the expansion board on both +5V and +5VBACKUP lines. This may be excessive, but overkill doesn't hurt

THE NEXT TIME I'm in there, I will probably switch the 4520 power line onto the battery backup, so it will power up in the bank I left it in, rather than at any bank at random as it does now. If I were doing it again, I would drive the 4511 off the same lines as the address, rather than using the second counter in the package, because on power up, the two halves of the counter chip might have different numbers in them, causing the bank display to "lie" to you until you go to bank zero (when both halves get a reset and get synched up again)
I have decided that the scan speed is too slow to make any practical use of the idea of decoding "20" in the channel number display and using it to clock the "bank" counter. With that many channels being scanned, the chances of catching anything diminish too far.

THE NEXT MOD is to put a fet switch (probably a TIS73 jfet) across the "speed" switch, with a capacitor from the gate to the switched +5V line and a resistor from the gate to ground. This should hold the "speed" key on the keypad closed on power up, so the machine starts off in "fast" speed, rather than in slow. I havent thought this one out yet, so if you beat me to it, lemme know how it works.
My OTHER scanner is a uniden 100 xl (not xlt). Last week I wrote to them asking about a service manual for that one. Since it is a lot faster than the 2020, and also a handheld, I would be really pleased if I could stuff more memory into that thing before this summer.

645. Re: Portable tower needed

I saw a pickuptruck-mounted crankup tower (I believe it went up
about 70 feet) at a ham swap in Phoenix a while back. Maybe someone
here on usenet knows of that person? I thought it was pretty nifty,
myself. What a slick way to get around the antenna ords! Only problem
is when the wind blows :-).

The scanty details I can remember are - it was permanently mounted in
the truck bed, could crank up quite a distance, and held some
VHF and UHF beams on the top. I don't know if he had any provisions
for guying the tower when parked - he did not have it guyed in Phoenix,
but then we did not have any wind that day.

Also, a 50-foot collapsible mast with a spiked bottom plate and guy wires
might do the trick. I am thinking that you would place the bottom plate
on the ground (spike downward), extend the mast sections while horizontal,
connect the guys, and raise the mast onto the bottom plate (perhaps by
having the mast connected to the plate via a hinge, maybe by just
having a stub the mast fits over). Tie down your guy wires, and there
you are. Oh, don't forget to put the antenna on before you raise it! :-)

Well, enough madness for one day. (Madness - thats what happens after
getting back from vacation!).

>don't seem to be too concerned about consumer electronics.
>

I don't agree. I just came back from Hawaii. Going thru the xray machine
in Worcester, Ma, they saw my airplane transceiver, had me take it out,
turn it on and get a VALID station (126.55 was ATIS) just to verify that
it was in fact a real radio and not "loaded" with something.

Coming back from Hawaii, they did that not only to my transceiver but also
to the camera.
--
-> Diana L. Syriac <-

To add my own experience: On a recent trip to FLA I packed my HTs,
camera, and battery packs for carry on and expected the worst.
Absolutely NO PROBLEM. Even coming back I expected to get checked
since I thought I might fit their profile: traveled alone, no checked
luggage, long hair and beard, and probably looking nervous as I was
using another person's ticket. The security seemed to be checking
everybody's carry on bags but didn't give either of mine a second
glance. Only on flights outside the US have I had my carry on
examined and then I had no radios. Maybe I looked too suspicious to
really be a terrorist or drug smuggler.

>I agree that we need to populate bands besides 2, 220, and 440. If we
>don't use them, we will most assuredly lose them.

For the second time in a month, I actually find myself agreeing with one of Jay Maynard's points. We do indeed need to populate the higher bands. But I do not feel that new modes should be restricted to them exclusively. There are several good reasons to provide space for packet operations on the "standard" bands (2m, 220 and 70cm) as well as the less populated UHF bands (33cm and 23cm).

One is to provide access for those with smaller budgets who may already have equipment for the lower frequencies that can be used part-time for packet.

A second is a result of the great importance of high performance linking and relay operations in packet. These are far more easily done when multiple bands are involved, because expensive duplexers can be avoided. I am presently working on a much more efficient channel access scheme for packet that requires each user station (not just the repeater) to operate full duplex. It is impractical to require each user to have a set of duplexer cavities, so cross-band operation is absolutely essential here.

Propagation is a third reason. Although amateur packet operation is almost always from fixed locations, most of it is multipoint in nature. Multipoint fixed operations require relatively low frequencies for the same reasons that mobile radio does: the need to use omnidirectional antennas, coupled with the increasing path loss associated with higher frequencies when omnis are used.

There must clearly be a fair and balanced distribution of packet activity across the various VHF/UHF bands. I encourage anyone who can to abandon 2m voluntarily for serious packet operations, but at the same time I will fight to preserve space for those who cannot move. I should point out that it was my own belief in the use of frequencies above 2m that led to the confrontation regarding 220 MHz that I mentioned earlier. Nor is 70cm exactly wide-open in many areas; if anything, it is even less efficiently used than 220 MHz. Lightly-used private "ego-machines" are everywhere. Together with the biggest bandwidth squanderer of them all (fast-scan TV), there isn't a lot of room left for much else.

In short, I'm willing to do my part to encourage the packet community to use its allocations more efficiently and to move to less congested bands whenever possible. In return I think I'm entitled to something more than foot-dragging and hand-wringing from the frequency coordinators.

Phil

649. Info / Ideas wanted for High School Radio Astronomy

Newsgroup: rec.ham-radio
Date: 1989-05-01 22:17:26 UTC
From: ted@uhccux.uhcc.hawaii.edu
Message-ID: <3879@uhccux.uhcc.hawaii.edu>
Source record: 18874
Cross-posted to: sci.astro,sci.edu,rec.ham-radio

I am seeking information, ideas, equipment needs and the like for
a High School based Radio Astronomy program.

We would be limited to about $5000, [more likely less ;-)] and
obviously can't construct a 300 foot dish. But a 4 meter one might
be reasonable, though yagis are easier.

This will first be set up in American Samoa, and if possible, spread
to a school in Hawai'i.

I figure that monitoring the sun and jupiter would not be beyond us,
and construction of a radio map of the sky would be reasonable too. Any
other ideas or suggestions. Observation programs we could do?

So, any SARA people on the net? or amateurs involved in radio astronomy?
Or professional type radio astronomers willing to contibute ideas?

One more request, anyone have the address of the Kettering Group in
the UK? e-mail or regular..

[as a side note, I hope to get students involved in amateur radio and
satellite use in this also, any ideas on that are welcome]

Please e-mail replies, if it gets intense, I'll synopsize and post.

Thanks cheers and penguins

I'd sure like to see something like this in the DX mags or on the net.
It wouldn't have to be a strident "This jerk doesn't QSL" sort of thing;
we could do it more politely, like "Has anyone QSL'd with [so and so] and
never gotten a reply?"

A friend told me about a certain EA station who's always very loud into
the US and doesn't seem to QSL. I went ahead a tried anyway since he was
my first EA, and have gotten nada back. I'd like to warn people (especially
new DXers) about such situations, to save them disappointment as well as
time and money. There must be a way we can do it without being openly
insulting.

Need to upgarde the ticket.???

Univ of Maryland sponsors W5YI ham test the first Saturday of the month.
Next time is May 6th, 10 am at the Student Activities Building next to the
TERP's field house. Bring 5 dollars and positive photo ID. Novice
thru Extra will be given.

A service of W3EAX, Univ of Maryland.

Need more info ? E-mail me or send packet to N4QQ @ N4QQ.

WB9VKO, Dave

From: Michael_Edelman%Wayne-MTS@UM.CC.UMICH.EDU
Message-ID: <139513@Wayne-MTS>
Source record: 18870

In response to Goh and Peter, yes, there is a species of moth that has a passive bat-avoidence ECM system. It's very elegant. The moth has two ears in its legs, each connected to the opposite wing in an inhibitory fashion. When a bat pings nearby, the moth turns away from the bat. If the bat is very close, both auditory nerves fire and the moth stops flying and plummets until out of range.

I don't remember any more specific info, as it's been a while since I was in physiological acoustics, but that one always stood out...

I am looking for info on mods for the 200/205XLT handheld scanner (the one that covers 800 MHz). Also, does anyone out there know the actual difference between the 200 and the 205? Apparently they are the same but I am not sure. I am interesting in getting one of these in place of my AOR 900, despite the 205XLT's larger size.

Please e-mail replies direct and I will post to the net if there is sufficient interest.

Re: Phil Karn's statement of 1May89 about the low gain of omnidirectional UHF antennas making 1.2 GHz unsuitable for multipoint use ....

Come on now Phil! I suspect that the people who make UHF TV transmitting antennas, and the 2 GHz educational TV antennas would be surprised to learn that UHF omnidirectional antennas have low gain.

Sure it takes stacked elements, but must packet radio always be conducted with the worst RF techniques possible?

Couldn't resist the chance....

> Well i got this coax that has about the same dimensions as rg 58 but
> it says rg 62b/u instead anyone got any ideas on its characteristics,
> especialy in respect to rg 58?
> ----------

Well, last time I answered a question about coax I suggested that the
poster look it up (it was a much more general question, however:
kinda like tell us all about every kind of coax there is). I
got flamed pretty well for that one -- so I'll try to be more helpful
this time :-) :

RG-62A/U: (my book doesn't have the -B version, but it's pretty safe
to say it's very similar...) Low capacitance, single barid.
Inner cond: .0253" solid copper-covered steel.
Dielectric: Polyethelene
Nom. diameter of dielectric: 0.146"
Shielding braid: Copper
Protective covering: IIa (Non-contaminating synthetic resin)
Nominal overall diameter: 0.242"
Weight: 0.382 lbs/ft
Nominal capacitance: 14.5 pF/ft
Maximum operating voltage: 750 volts RMS
Now, the one you won't like -- Impedance: 93 ohms

From: charlie@oakhill.UUCP
Message-ID: <2018@radio.oakhill.UUCP>
Source record: 18995

How does the new AM broadcast standard NRSC work? Is it
basically a sharp (translate brickwall) filter in the program
audio to limit the bandwidth due to modulation sidebands? If
so what does one use? An 8th order elliptical filter or
a digital FIR filter (linear phase)? Any technical poop
anyone has would be greatly appreciated.

What is the difference in NRSC-1 and NRSC-2?

Oh boy! If we limit the bandwidth of modulation sidebands
we can build AM radios that will sound better! am I right?

660. 32AT MIC

Newsgroup: rec.ham-radio
Date: 1989-05-02 16:17:02 UTC
From: faunt@CISCO.COM
Message-ID: <8905030702.AA22114@ucbvax.Berkeley.EDU>
Source record: 18979

I actually didn't figure out why, but for packet, the two wire connection works fine. I suspect that the other connection is for power to the mic preamp/VOX unit for the headset, but is protected well enough so that shorting it to ground is OK. I'm using a Heath Pocket Packet which came with the right cables (one mini-phone at each end, one micro-phone at each end), and has the correct circuitry built-in for use with units like the 32.

I've built a couple of G5RV's and they resonate on 20 meters near 14.150 as
I recall. I tuned the feeder by starting a couple of feet long and cutting
until swr at 14.150 was flat. The ARRL Antenna Compendium was the source
of information I used. I found that the book figures were a bit long and
the antenna worked better after trimming. Since a tuner is used it isn't
necessary for resonance to operate correctly but the bandwidth without
readjusting the tuner is larger when trimmed. BTW, I've found the impedances
near the top end of 80M (above about 3900) to vary quickly with frequency
and give my Icom automatic tuners fits. It is possible to tune manually
but bandwidth is very narrow. Impedance measurements indicate rapidly
varying reactances with respect to frequency. These effects improved with
trimming (moved up in freq away from band center) but I didn't trim further
to see if they could be moved out of band.

I'm about to move into a place where I have an opportunity to build a decent (non-tower) SWL antenna outside. Anyone want to make recommendations on good books to buy for antenna design ideas? This is for SWL and will be receive-only. One thing I'd really like to do is put up a second antenna specifically for MW (broadcast AM) DXing as well, so a book that'll give me some help there would be especially appreciated.

thanks!

The biggest problem with the bands above 450 MHz is the lack of equipment for Joe Typical User. 1.2GHz equipment is available, but not cheap, and the coverage is often spotty. 902 MHz suffers from a malady not unlike 220; since the Japanese don't have a band there, they won't develop equipment for it.

I sincerely hope that no - code doubles or even triples the US ham population. The most significant impact on the rest of us would be the likely resurrection of Collins and Drake, who are likely to see one million hams as a "real market".

I would suspect that you are close to either a current loop or node at the
tuner which would cause that effect. To really have a "broadband" antenna
at 80M you need a smaller L/D ration, as in a "cage dipole". They are not
hard to make with plastic rulers as separators and can give a coax fed
dipole that is <1.5 SWR over 3.5-4.0 Mhz. See the Antenna Book for more
detail.

The same principle may work with a G5RV, but its hard to say since that
antenna depends on some specific impedance mismatches. Worth a try though.

667. novice rigs

Newsgroup: rec.ham-radio
Date: 1989-05-02 21:38:49 UTC
From: m2lab: <>;
Message-ID: <8905022138.AA01825@mmlai.LOCAL>
Source record: 18998

I just recently passed my novice exam and I am interested in buying a good used transceiver for 80 to 10 meters. The new rigs by ICOM, Kenwood, Yaesu, etc. are nice but rather expensive. I own a Realistic DX-440 receiver for general shortwave reception, so I *may* be able to get away with a transmitter only. However, I'm unsure of the suitability of the DX-440 as a ham receiver because of its selectivity, and the added inconvenience of a T/R switch.

Basically, I need some advice from hams about rigs that they have used or are using, including both good and bad points, estimated cost, and availability. Any info on features to look for, pitfalls to avoid, exceptionally good or bad rigs, etc. would be welcome. I also welcome any advice on the suitability of the DX-440 as a ham receiver, transceiver vs. separate transmitter and receiver (incl. difficulty of "zero beating"), good sources for equipment, antenna construction tips, and any additional information that would be helpful to a brand new ham.

Thanks in advance,

Bill

> It may take computers to do it but we should be looking forward to something
> even more comprehensive. What about voice mail, picture mail and other apps...

Agreed. I would suggest that something like "Amateur Digital Systems Conference" would be more appropriate. This covers the majority of the current and future work under one umbrella.

I've been toying with some ideas for a voice mail interface, perhaps using Phil's package for the transfer (there exists a voice mail protocol, though it is old and pretty much outdated). In a PC-based system, it wouldn't take much to set up a rudimentary VM interface. A DAC/ADC pair with a little analog glue on a board is all that is really necessary. The interface would be a microphone and speaker for I/O, with the software interface being a simple VM browser, allowing the user to 'read' mail and queue messages for delivery to other amateurs. The NET package would do the delivery, though ideally a new protocol would be implemented so that true binary transfers could take place (skipping the binary-to-ascii conversion and allowing data compression and perhaps (maybe someday) encryption). As an alternative to having the PC spoon feed the DAC/ADC pair, a Motorola 56K can be placed on the board to do all the work (and in its spare time it can be used as a modem or image processor).

Along the same lines, we have the potential to do some really exciting things with imaging, using amateur digital communications as the transport medium. Besides the obvious uses of `picture mail' and other one-shot style image exchange, we can start using amateur radio to do `real work'. Images from space can be downloaded from satellites for image processing and display on the user's screen (one of the AMSAT/TAPR microsats will apparently have this capability). The CCD-array observatory down the road can be controlled remotely via packet radio, with the scanned images transferred and displayed at one or more locations in the area. Here amateur radio becomes more of a tool for other hobbies rather than the main hobby of interest.

The hardware to do these kinds of tasks (reasonable compute power, usable monitor resolutions, etc.) is available today. Of course, to reduce the data transfer times down to a reasonable level, high-speed modems are the hardware of choice, with much work to be done to make them available cheaply.

I don't think we should limit ourselves to just "Gee, Bob, I lost another tooth today..." type communications (as we see often in packet radio). There are a lot of other exciting things we can do with our hobby, perhaps attracting new, interesting people to the hobby in the process.

What's NeXT using? Their machines come with a nifty voice mail, that is somehow glued to regular Unix mail. I had one for a few days, and did 'od -x' on some mail enough to see there was a jumble of binary data.

I'm all for stealing, er, ah, *reusing* things others have worked the bugs out of, rather than rolling my own.

I believe that the DX Bulletin carries something like this; they indicate the "waiting time" for qsls from either direct or via a manager. They will also usually list those dx stations who "NEVER QSL". Of course, one action in this case, is to see about becoming a qsl manager. I have done this for a station or two with a couple of YEAR backlog. After a few months work, I have cleared the backlog and have a few IRCs to show for the effort. QSL managing is basically charity work, but if you can help some people get a qsl card, its well worth it....

I own both the TH-25AT and the TH-45AT. I have modified both to transmit and receive outside of the amateur bands (the 2m rig already rx out of the band). I am a tad too busy now to post the modification instructions, but I will do so in about 5 weeks when the current term is over. In addition to not having a whole bunch of time, some of the information is at a relative's house in a distant city. Please QRX for future mods info.

Disclaimer: I am in no way sanctioning the illegal activity of transmitting on a band for which one does not have a license, and/or with non-type accepted equipment.

Question: When will the HT manufacturers build a rig on 70cm that will recieve non-amateur frequencies? They already include different features for different countries/geographical areas. There is certainly a market in the USA for such a rig. Are the Japanese really so shortsighted not to have figured this out?

> a digital FIR filter (linear phase)?

I think the specification is -1.5 dB at 10 kHz and
-30 dB at 11.5 kHz. (I have the stupid standard at home).
The filter should be linear phase, for obvious reasons. Most
of them are pretty basic fifth order or higher ellipticals;
I'm waiting for someone to do a digital one.

NRSC-1 is the "audio mask" designed to provide for
the 10 kHz brickwall filter and a 75 uS preemphasis character-
istic. It is voluntary, and is the line of first attack at
reducing the occupied bandwidth. Most audio processing
leaves junk behind up to 30 kHz or so (except for newer
Orban /CRL stuff which had gentle filtering) which wastes
transmitter power, stomps your neighbours with splatter,
and so on. However, many transmitters still spew garbage
(like a misadjusted Ampliphase) after NRSC 1, soooo....

we have NRSC-2. This is the "RF mask" proposal.
Basically, it is a tightening up of the occupied bandwidth
specification to take care of dirty transmitters.

NRSC-1 is sooooo wonderful that I doubt that NRSC-2
will become mandatory, at least for a little while. If
we are going to have NRSC-compliant receivers, though,
we probably need both.

677. DAYTON NEWS

Newsgroup: rec.ham-radio
Date: 1989-05-03 18:24:34 UTC
From: ewb@raybed2.UUCP
Message-ID: <1307@raybed2.UUCP>
Source record: 19013

Well here is some of the news from DAYTON.

New RIGS: ICOM with the IC3-SAT, very very small, built in battery, 48 memories, 10 phone memories, built in on-off timer etc, r9000, very impressive very expensive, IC-4KL fancy 2 piece full legal limit amp.

YAESU: Announced their NEW HF RADIO. It is designed to compete with the ICOM 765. The Yaesu version has DDS, two VFO's with their own knobs and readouts, selectable filtering for each vfo, dual receive capability, built in C.W. KEYER (take that all you no-coders :-)) as well as a voice storage for calling "CQ" during a contest or whatever. It also can record the last 30 seconds of the receive audio in case you miss that callsign in the heat of the contest. Lots of other nice features. Price "under $4000.00" Look for a lot of new and innovative products from Yaesu in the future. Also they spoke about a remote control head for the FT-747 !

KENWOOD: Kenwood said emphatically that there is NO TS-950 on the horizon. They basically said that it's already the best so how can you improve it ! (Ya, sure)

GROVE: Bob Grove actually showed up with his sr-1000. It looked ok. The pan display was not working at the time. Front panel kind of rough compared with the overseas stuff.

Lots of other good stuff such as AEA's new ATV tranceiver etc. BTW did anyone else see the QSL holder booth next to the weather instrument company ?

Dayton was a blast. I have my reservations for next year already and would highly recommend it to everyone even though it rained all over the flea market 2 days in a row !

Very true, but if you are serious about DXing and word gets out that you are manager for a bunch of rare ones it is suprising how much easier it is to hear your call in a pileup. Alls fair in love, war, and DXing!

>antennas, and the 2 GHz educational TV antennas would be surprised to
>learn that UHF omnidirectional antennas have low gain.
>
>Sure it takes stacked elements, but must packet radio always be conducted
>with the worst RF techniques possible?

When I was in college, I worked summers at the Maryland Center for Public Broadcasting in Owings Mills. Part of my job involved operating the local UHF TV transmitter. It ran about 50kw peak on channel 67 to a rather elaborate (yet still omnidirectional) antenna, yielding a peak ERP of about 650 kw. Nevertheless, it was barely receivable in Baltimore, 15 or so miles away. It wasn't until the Annapolis transmitter on channel 22 went on the air in 1976 (with 5 MW peak ERP) that Baltimoreans could watch PBS with a decent signal.

Okay, so this is a cheap shot. (Lousy UHF TV reception is almost always primarily the fault of incredibly poor receiver design.) But it is still true that multipoint communication becomes harder with increasing RF frequency. Assuming constant antenna gains, the free space path loss between them goes up by 6dB with each doubling of frequency according to the formula

path loss (in dB) = 20*log10(4*pi*D/l) ~= 22 + 20*log10(D/l)

where D = distance in meters
l = wavelength in meters

Since D/l is just the distance in wavelengths between the receiver and transmitter, you can see how path loss goes up with increasing frequency.

Another way of looking at this is to consider that as frequency increases, the effective aperture (area) of an antenna with a given gain decreases by 6 dB/octave. But an antenna with a fixed aperture (e.g., a parabolic dish) has a gain that increases by 6 dB/octave, and this can cancel out the increasing path loss. So let's look at a few combinations of antennas and frequencies:

TX antenna RX antenna Net gain/frequency
fixed gain fixed gain -6 dB/octave
fixed gain fixed aperture 0 dB/octave
fixed aperture fixed aperture +6 dB/octave

You can see that if you can use fixed aperture antennas, you actually win by going to higher frequencies. This is why microwaves are so nice for fixed point-to-point links -- assuming you don't lose out to other frequency-dependent effects found in the real world, such as decreased scattering beyond line-of-sight range, plus increasing receiver noise, foliage absorption and possibly water and/or atmospheric absorption if the frequency is high enough (> 10 GHz).

Depending on the type of omni antenna you use in your packet station, you may or may not be able to flatten the pattern and increase the gain (e.g., by stacking) as you go up in frequency. If you can't, you're obviously going to be at a disadvantage. And few end-user stations (as opposed to linking sites on tall towers) are going to have line-of-sight paths to their neighbors or even their local repeater sites -- and this single factor will probably outweigh all others.

As much as I'd love to see greater use made of our higher frequency bands, these and other practical considerations all point to a packet network architecture where the end-user stations operate in a multiple access mode on VHF and UHF frequencies. Each user group is then interconnected by point-to-point backbone links operating on microwave frequencies from good sites (towers, mountaintops). The precise dividing line between "multipoint" (i.e., end-user) and "point-to-point" (i.e., backbone) frequencies will have to be experimentally determined. It will depend a lot on the local geography, but I expect it to be somewhere in the region of 1 GHz. It might be considerably higher in California (where all the users in a valley might well be line-of-sight to a mountaintop repeater site) and considerably lower in Northern New Jersey (where dense foliage and rolling hills make good line of sight paths very rare).

Phil

>73 Bob, W3OTC

Unfortunately, this has the consequence of worsening the Hidden Station Problem, especially if your network has been constructed in the Real World, which has RF absorbing foliage.

In any event, it is spectrally inefficient to operate a multiaccess network above one gigahertz. Potential antenna gain for a reasonable sized array easily overcomes the advantage of spectrum reuse.

For more information, consult my paper in the 1987 ARRL Network Conference Proceedings.

> [This is myself speaking. No company can control my thoughts.]
>
> Bookends. What a wonderful thought.

A simple source of these books is the "Popular Communications Book
Shop". They have several books on SWL antennas and have tons of books on
SWLing and Frequency lists.

Popular Communications
76 North Broadway
Hicksville
New York 11801

Phone: (516) 681-2922

Visa and MasterCharge OK.

They have Ed Noll's new book "Easy-up Antennas for Radio Listeners
and Hams" 163 pages $16.95.

I have often amazed myself at how well a random long wire works as an
SWL antenna, once outperforming a $70.00 BC SWL antenna. Also for Medium
wave, a good long wire and decent ground will work wonders. For
directionality a large loop antenna is unbeatable.

Yours

Sb: #RUSSIAN PHRASES FOR HAMS
Fm: Len Traubman DDS / W6HJK 73147,3073
To: ALL

RUSSIAN PHRASES FOR AMATEUR RADIO
==========

This is a new 20-page syllabus compiled by W6HJK to help amateurs better communicate with their Soviet colleagues. You need not be an expert in Russian, only interested in "trying."

The booklet provides (1) English words and phrases for QSOs, accompanied by (2) the Russian translation and (3) the English transliteration, to assist you in pronouncing the Russian.

The syllabus follows the natural sequence of a QSO. There are additional sections on the Russian alphabet, phonetics, CW characters, numerals, and given names. Suggestions are made for addressing mail to the Soviet Union.

The author undertook this project out of a personal interest in improving the quality of his QSOs with Soviet hams and to enhance USA-USSR relations. This booklet is provided free of charge, with the first printing and mailing funded by Beyond War, an educational foundation to build global dialogue and cooperation. If it is useful, you may later choose to make a contribution to help sustain this project.

Requests should be sent to:

RUSSIAN PHRASES FOR AMATEUR RADIO
Len Traubman, W6HJK
1448 Cedarwood Drive
San Mateo, California 94403, USA

PLEASE ANNOUNCE THIS:
(0) on other bulletin boards.
(1) in your club or society publications.
(2) to other hams with whom you speak or meet.

Many thanks, Len

689. RE: Omni for UHF

Newsgroup: rec.ham-radio
Date: 1989-05-04 12:28:36 UTC
From: rwb@vi.ri.cmu.edu
Message-ID: <4897@pt.cs.cmu.edu>
Source record: 18929

I suggest going to horizontal polarization for such a network. Above 1 Ghz, omnidirectional high gain antennas are actually easier to build for horizontal polarization than for vertical polarization.

The antenna I'm referring to is called an Alford slot. It consists of a vertical cylinder a few wavelengths long with a vertical slot cut in it. It can be made from a piece of metal tubing.

The slotted cylinder has a velocity factor > 1, which permits a multi wavelength length to have a dipole type current distribution, which results in the high gain.

Of course, the waves don't really travel faster than light. However, the standing wave pattern sets up phase relationships that make it appear has if they do. Imagine a hidden phasing line setup which provides 2.1 cycles of delay between elements spaced every wavelength apart. To an outside observer, waves seem to travel between the elements at 10x the speed of light. This same kind of phasing is what happens in the Alford slot.

The "Microwave Newsletter Technical Collection" has designs for microwave Alford slots. ATV groups have also used these on 432 Mhz.

I could have emailed this to Dave, but I felt others might benefit from the info, so here goes. You can find an excellent article on making your own connectors for hardline (smooth- jacketed aluminum) or Andrew Heliax (tm) in the April 1987 issue of QST. The article is titled "Hardline Coaxial Connectors You Can Make" (original, eh?) and was written by George Chaney, W5JTL. It begins on page 32. I have constructed several of the connectors he described and they work GREAT! I even use a pair of homebrew 7/8" connectors on my 1296 EME transmit feedline and they perform as well as the Andrew parts, at a much lower cost (almost free vs. about $45 each).

Give 'em a try.

To receive a copy of a file, send email to the userid: bitlib@uwo.ca
The subject must be MODS. The text of the message contains the file
requests. Example:

sendme intro mods
sendme radio mods

If it looks as if you have seen these files before, your probally
correct. Most of the files have been taken from messages posted to
INFO-HAMS digest. Any new files posted will be retained, or send mail
to userid: mbramwel@uwo.ca

This is a list of files available from the RADIO MODS archive.

FILENAME DESCRIPTION of MODIFICATION
-------------- ------------------------------------------------

INTRO MODS Introduction to the archive.

RADIO MODS The file you are reading now.

TH215 MODS Extend frequency coverage of this hand held.

TS711 MODS Extend frequency coverage from 141.0 to 150.995mhz.

TS440 MODS Extend TX to full RX, add 10HZ digit display.

ALLBAND MODS Extend TX on many Kenwood and ICOM radios.
The list includes IC-02AT, Yaesu 757GX, Kenwood 2600,
TS-430S, TS-940, TS-930, TS-440, IC-720,
IC-735, IC-745, IC-751, Icom M-700(Marine HF)

PRO2004 MODS Add cellular coverage to scanner.

PRO34 MODS Add coverage to the scanner.
TM2570A MODS Extend freq rx/tx 141.0 - 150.995mhz 2530/2550/2570A

IC28 MODS Extend TX 138 - 174mhz IC-28A & IC-28H

ICOM32AT MODS Info on hand-held
IC32 MODS More info on Icom handie, this file is different
than ICOM32AT MODS.

FT23R MODS RX/TX 140.0 - 163.995mhz.

FT727R MODS rx/tx 139-160mhz 420-460mhz

760XLT MODS Extending frequency coverage to this scanner.
```

TM721 MODS Turn the Kenwood dual-bander into a repeater.
TM721-2 MODS More info on TM721 rig.

IC900 MODS Expand RX/TX on many modules/bands

FT411 MODS RX 130-174 TX 140-150

R7000 MODS Fix the flaky display & loss of gain.

TINY2TNC MODS Mod/Fix for hard-of-hearing TNC.

** Since I do not personally own every piece of radio equipment
available, I can not insure how accurate are the various mods.
Questions with specific mods should be directed to the
original poster.

This file is: INTRO MODS

MODS database
---- --------

This database was setup to archive files containing information on
how to modify radio equipement to either improve its performance,
or add new functions or capabilities to the radio.

This database runs on a IBM 4381 under VM/CMS. The driving software
is a homebrew list exploder with extra routines to handle file requests
from mail. The software was written in REXX and is available to whomever
likes to take a look at it. It was my first real REXX program so be gentil
with regards to beauty of the logic.

To access a file from the archive, send a message to the server running
under userid -> BITLIB@UWO.CA
Also you may try the userid -> BITLIB@UWO.CDN

The subject of the message must be -> MODS

The text of your message descibes what files you want. For example:
sendme intro mods
sendme radio mods
sendme TH215 mods

You can have as many requests in the same message as required.
INTRO MODS is the file you are reading now.
RADIO MODS is a list of files available.
TH-215 MODS is a file that can be requested.

To submit a file for the database, send me the message and I will
add your entry to the database.

**Note: If you don't seem to be getting a reply to your requests, it is
probally due to the fact that your header doesn't show a reachable
address. You must be reachable from UWO. You can place your return
address in the first line of your message. Example:
FROM: someuser@somenode

UUCP users have had some success by stating their address as:
userx!usery!userz@julian.uucp
Julian can usually find most gateways.

Any questions or concerns can be directed to:

According to our Technical Librarian the Navy keeps manuals for just about
everything on microfilm. You can get the unclassified ones for the cost of
copying by making a FOIA request.

You might call your local University Engineering library for address/form
info. though. It has been my experience that they are extremly helpful,
and the Navy generally gets the manual to you in a month or so.

I have got some really wierd test equipment manuals from them that I never
thought had ANY military interest.

697. 954.3 MHz

Newsgroup: rec.ham-radio
Date: 1989-05-04 19:27:31 UTC
From: wjc@XN.LL.MIT.EDU
Message-ID: <1369@xn.LL.MIT.EDU>
Source record: 19017

I've been doing some RF snooping with a spectrum analyzer and have discovered a signal at 954.3 MHz (+/- a few kHz). My location is Lexington, MA.

The signal looks like wideband FM in a channel about 200 kHz wide. However, when I listen to the video output of the analyzer (this allows you to hear AM signals or FM signals via slope detection) I get only garbled voices. It almost sounds like SSB without a BFO. The signal is apparently present throughout the day and is a continuous (i.e. not PTT keyed) transmission.

The best information I have says that the 952 MHz - 980 MHz band is allocated for "Operational Fixed, Domestic Fixed Public."

Does anyone know what this signal might be?

>audio to limit the bandwidth due to modulation sidebands? If
>so what does one use? An 8th order elliptical filter or
>a digital FIR filter (linear phase)? Any technical poop
>anyone has would be greatly appreciated.

NRSC-1 is the audio portion of the specification. It consists of a 75 uS pre-emphasis (the same as used for FM) and a 10 KHz bandwidth. The response must fall very rapidly above 10 KHz. Most processors use sharp analog filters to do this, but there is nothing in the specification the precludes using digital filters. We can expect to see more and more of a station's signal chain to become digital as years pass. I just returned from the NAB convention in Las Vegas, and someone presented a paper on a way to digitally generate an FM stereo signal. The only analog parts of the signal path were a frequency up-converter and the RF power amplifier!

>What is the difference in NRSC-1 and NRSC-2?

NRSC-2, also called the "RF mask," pertains to the radiated emissions from the antenna. Again, a rapidly falling response beyond +/- 10 KHz is specified. It is expected that most stations that adhere to NRSC-1 will be in compliance with NRSC-2 automatically. NRSC-2 was needed mostly for older transmitters that add enough distortion to widen the sidebands. Also, NRSC-1, by itself, is not sufficient to guarantee against radical audio processing by the station that results in components above 10 KHz.

>Oh boy! If we limit the bandwidth of modulation sidebands
>we can build AM radios that will sound better! am I right?

That is precisely the intention of the NRSC. The demo at the NAB show was quite effective in showing the improvements. The bandlimiting greatly reduces adjacent channel interference (splatter), and the pre-emphasis reduces noise and whistles (10 KHz heterodynes). This should make nighttime listening bearable, as well as encourage manufacturers to make wideband radios.

The FCC has just put both standards into law. Compliance with NRSC-1 will be required as of June, 1990. Compliance with NRSC-2 will be required as of several years later, mostly because of difficulties in measurement and modifications or replacement of transmitting equipment that may be necessary in some cases.

>to the Soviet Union.

Sounds like a thorough job. If you'd like similar information for
several other languages, check out "The Radio Amateur's Conversation
Guide" by OH1BR and OH2BAD. It's a 90-page book with commonly needed
ham phrases translated into German, French, Italian, Portuguese, Spanish,
Russian, and Japanese. The latter two are given as transliterations (plus
Cyrillic for the Russian). Supplements are available for Danish, Serbo-
Croation, and some other languages. There are also accompanying audio tapes.

About 2/3 of the book consists of the aforementioned phrases, with the
remaining part devoted to a multilingual dictionary. I have just a few
minor gripes about it, such as lack of a pronunciation guide, and of
the phrases you'd need when filling out a QSL card. But all in all,
a handy book.

Last I knew, it was being distributed in the U.S. by Transelectro-
America of Long Beach, CA. However, I noticed at Dayton that _CQ Magazine_
also sells the book and tapes, so you can evidently order through
their bookstore service. I think the main book is about $10.

73,
Patty

Disclaimer: Just a satisfied user; I don't know the authors or publishers.
I do have a working relationship with CQ, but they've never offered me
a commission for bringing in book sales. :-)

700. Ham radar?

Newsgroup: rec.ham-radio
Date: 1989-05-04 21:18:00 UTC
From: commgrp@silver.bacs.indiana.edu
Message-ID: <12600057@silver>
Source record: 18935

Have hams experimented with weather radar? My local Skywarn group wants one. Used aircraft and marine radars of dubious serviceability have appeared at the Dayton fleamarket. X-band radars might be retuneable to the 10-GHz ham band. Is pulse radar practical within the 1-kW ham power limit?

Lower frequencies (5-6 GHz?) are optimal for detecting precipitation, however, radars for those frequencies are bulky and usually require 400 Hz 3-phase power (supplied by LARGE aircraft).

One elegant solution is an ATV repeater in Indianapolis with a National Weather Service weather-radar video feed, activated by touch-tone command. This has been invaluable during tornado seasons but is not currently receivable here.

What kind of license is needed for non-ham radars? Is it legal to operate a marine or aircraft radar which is not mounted on a boat or plane? Other than tilting the antenna upward, are there ways to optimize marine radars for observing weather (by changing integration time-constants, etc.)?

Some television stations' weather radar is converted military surplus; does anyone know types/availability/prices?

Marine-electronics shops might be good places to shop for used radars. Sources, anyone?

A good 'ol long wire will probably to the trick for SWL (stranded copper wire is good).

If you're REALLY in to it, get a copy of the ARRL Antenna Book.
Last, Popular Electronics Magazine has SWL articles and some antenna advertisers often have ads for SWL antennas and books about the same.

'Have fun...

You're doing the same thing I did when I first became interested in radio communications. It leads to "harder stuff" (amateur radio, in my case).

705. ARRL DX Bulletin Nr 18

Newsgroup: rec.ham-radio
Date: 1989-05-05 00:49:29 UTC
From: k2ph@dxis.ATT.COM
Message-ID: <128@dxis.ATT.COM>
Source record: 19024

Hr DX bulletin nr 18 arld018 from ARRL Headquarters Newington CT
May 5, 1989 to all radio amateurs - Thanks to KB1BE and the Connecticut
DX Association for the following DX information.

DXCC Desk. Malagasy Republic. Documentation for the 5R8VT operation
has been received. DXCC credit for this operation will begin with the
applications received on April 3, 1989 and after.

Ocean Island. The DXpedition to this possible new DXCC country by Jim
Smith, VK9NS, and Bob, KN6J, has been delayed until May 10 because of
transportation problems. They expect to leave Tarawa on Saturday and
be operational by midweek signing T33JS on CW and SSB and T33RA on RTTY
and on six meters. QSL T33JS by VK9NS and T33RA by KN6J.

South Georgia. VP8BUB comes up Sundays at 1600Z on 28470 kHz, working
Europeans and Africans first and then stateside. QSL to G4YLO.

Marion Island. Peter, ZS8MI, is becoming more active as his work
schedule now allows. He is active on 14122 kHz around 0700Z and for
stateside 14256 kHz at 1400Z. He was also worked last Sunday around
28517 kHz at 1600Z. QSL to his home call, ZS6PT.

Aruba. Nao, N1CIX, will activate P40P May 8 through 18, 10 to 80
meters CW and SSB, including the new WARC bands. Accompanying him will
be Claudia, HB9CUY, who will sign P40YL. QSL to their home calls.

Mozambique. Ron, C9MKT, will not be active in June, the last month of
his current license, but will have two May dates. If you still need
C9, May 12 to 14 and 19 to 21 are possibly the last opportunities for a
while.

Central African Republic. Tom, 9Q5NW, is expected to operate as TL8TG
for two days around May 5 and will feature CW on 10 to 20 meters.

Pacific DXpedition. Bing, VK2BCH, will be off in May on his sixth
Pacific DX tour. He will be active on all bands, 160 through 6
meters, starting May 14 as ZK1XV in the South Cook Island through
June 8, then 5W1GY June 8 to 15 from Western Samoa. The next stop is
KH8/VK2BCH June 16 to July 7 from American Samoa. Tokelau, ZK3, and
Rotuma, 3D2, stops are also planned within the July 8 to August 8 time
frame. All QSLs go to VK2BCH, Box 344, Forster, NSW 2428, Australia.

706. Help me (possibly others) !!!

Newsgroup: rec.ham-radio
Date: 1989-05-05 01:32:22 UTC
From: atula@cs.keele.ac.uk
Message-ID: <604@kl-cs.UUCP>
Source record: 19025
Cross-posted to: rec.ham-radio,rec.ham-radio.packet

Hi everybody.

I am an amature to the amature radio. Over past few weeks say(5-6) I was regularly reading, rec.ham-radio and rec.ham-radio.packet. Things appeard were remarkable, and grate, despite the problem that I know nothing about that. But I would like to carry on, because it is fasinating. But some wizard(s) may like to help me or possibly quite a lot of people like me. The area which I am particularly interested is in radio packet switching. There were quite a few terms which I collected over past few weeks, that I don't understand is :

BAOUT
AMTOR
KISS
TNC
PK232
....
,.....

list is longer but I suppose this would say someting about my knowledge. :-) I would like somebody write brief introdcuction to this group about this and possibly how to start up. In otherwords what I am asking may be how to start up as an amature. Most possibly these questions have been asked sevaral times in the past. I would be most grateful for some overviews and possibly pointers to good startup books and start-up kits. etc. etc.

Thanks for your patience.

Athula.

707. 6,400 channels for your PRO-2004 scanner

Newsgroup: rec.ham-radio
Date: 1989-05-05 03:00:37 UTC
From: parnass@ihuxz.ATT.COM
Message-ID: <4461@ihuxz.ATT.COM>
Source record: 19026

x
6,400 CHANNELS FOR YOUR PRO-2004 SCANNER

by Bob Parnass, AJ9S

Chicagoan Denny Beringer sent in a few sheets he picked up at Dayton describing a modification to expand the memory in the Radio ShackO PRO-2004 scanner from 300 to 6,400 channels.

The new circuitry adds 3 ICs, a 7 segment readout, a ribbon cable, a pushbutton switch, and a few resistors and capacitors.

First, diode D510 is added which expands the scanner from 300 to 400 channels. Then, IC504, the stock memory memory IC (a uPD446G), is removed and replaced by a ribbon cable leading to an added printed circuit board. The additional board contains an HM62256 32Kx8 static RAM IC, which holds 16 groups of 400 channels each.

A pushbutton switch, attached to a 4060 CMOS 14 bit binary counter IC, selects one of the 16 groups. The 4 counter output leads are used to select the high order 4 bits of the HM62256. The new group select pushbutton switch is mounted on the front panel, in place of the headphone jack.

How can you tell which group you are in? A specially programmed EPROM (type 2716, 2532, or 2732) is addressed by the ouput of the counter. The EPROM output is connected to a 7 segment LED readout, mounted in place of the Sound Squelch pushbutton. The readout indicates groups 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, A, B, C, D, E, and F.

[Note: If I were to expand the memory in my PRO-2004, I would use just the new HM62256 memory IC and a BCD switch instead of the pushbutton. This would eliminate two of the three ICs, and the 7 segment readout. Sorry, I cannot provide further information, nor a reference, as the sheets sent to me contained no name or address. - Bob Parnass]

Subject: Crossed-Field Antennas: More?

In INFO-HAMS Digests V89 #307 and #313, there were postings on the subject of Crossed-Field Antennas. When I relayed this information on the local MARS net, it naturally caused quite a stir, and I fully expected this item to also raise a ruckus on this net, too. However ... I've yet to see any other discussion, so I'm beginning to think the whole thing was a April put-on. Quite frankly, an efficient antenna sized at 1% of the operating wavelength seems too good to be true, but would be a boon for those of us in "antenna-unfriendly" residences. Anybody have any other info on these things?

> The signal looks like wideband FM in a channel about 200 kHz wide.
> Does anyone know what this signal might be?

Frequency: 954.3 MHz

Transmitter site: Adover, MA (Essex County), Holt Hill
Receiver site: MA State Police
Framingham, MA (Middlesex County)

Emission: 100F9
Antenna: Parabolic

If this is not the signal you hear, it may give you some clue
to the licensee on this frequency in your state. The data is
from January 1987.

711. Headset & Earphone Laws

Newsgroup: rec.ham-radio
Date: 1989-05-05 12:15:36 UTC
From: gdelong@cvman.UUCP
Message-ID: <8905051215.AA07321@cvman.prime.com>
Source record: 18934

Some discussion has gone on regarding state laws relating to earphones
and headsets in motor vehicles. The following is compiled from some
information publications for motorcyclists:

--
The following states prohibit earphones, headsets, and/or helmet speakers:

Alaska, Florida, Georgia, Massachusetts, Minnesota, Virginia & Washington.

The following states prohibit devices covering or obstructing the hearing
in both ears, but permit single ear devices:

California & Maryland.

Texas has a statute (Sec. 1390) with requires such devices must be
"exclusively for safety or law enforcement purposes and approved by
Dept. of Public Safety."

Illinois Chapt. 95 1/2; 12-610: restricts use of "headsets". (I really
don't know what this means.)

The following states seem to have no statutes directly relating to the topic:
(beware of possable related charges ie: inattention, etc.)

Kansas & Oklahoma.

The remainder of the states, the District of Columbia, and Puerto Rico
permit headsets, earphones and/or helmet speakers.
--

I of course can not personally swear to the accuracy of the above, but
since motorcycle laws very so much from state to state, the various
m/c groups have done a pretty good job of maintaining lists of statutes
which may effect a touring rider. Anyone with "positive knowledge" of
errors in the above is requested to advise me of the correct information.

Hope it helps.

73, Gary

Paul,
This isn't quite the case. The Japanese certainly *do* have a band at 903 MHz
(maybe that isn't what you meant). It is basically the equivalent of our CB but
runs 5-10W and NBFM. From what I understand it is slightly on the decline now but
still populated. Word has it that the Japanese Mafia tends to control it (heavily
influenced by the truckers) and if you show up on the band someone comes to your
door looking for money.
However hardware does exist for both bands. At 900 MHz the Class C power amplifiers
are quite a bargain. I have recently received a moderate quantitiy of drivers and
finals, both are "bricks", which take one from 1 mW to over 10W. Combined cost
was under $10. I anticipate that we will be putting these on in northern California
on FSK for higher speed (>= 500Kbaud) TCP/IP packet switches very soon. The first
prototype is about complete. Look for construction details to come later this year.
Numerous manufacturers make these 900 MHz bricks (Mitsubishi, Toshiba, Matsushita
etc) and they should be available here soon if they aren't already.
For 220 MHz look for Mitsubishi M57774 (25W FM), M67712 (25W all mode) and M67713 (5W FM).
For 900 MHz the M567736(15W), M57744 and M67720(20W) should be interesting.
For 1200 MHz the M57762 is available from RF Parts ($70?) and makes almost 20W linear
and over 30W saturated. It is a real bargain for that band being cheaper and easier
solution to a complete amplifier than the previous alternatives (NEC NEL1306/1320)
was for devices alone (I know, I designed and built one before the bricks were
available).

>I sincerely hope that no - code doubles or even triples the US ham population.
>The most significant impact on the rest of us would be the likely resurrection
>of Collins and Drake, who are likely to see one million hams as a "real
>market".

I hope for an improvement in the ranks too, but I am afraid that unless we have
something more interesting to offer than 20 Meter pile-ups and 2M repeaters we may
not get it. Anyone interested in an amateur nationwide/worldwide high speed network which
would support moderate bandwiths for audio and video in addition to computer-computer
connections for electronic mail, bulletins, file transfer and remote log in?
The technology is *here* and it isn't even expensive!

>antennas, and the 2 GHz educational TV antennas would be surprised to
>learn that UHF omnidirectional antennas have low gain.
>
>Sure it takes stacked elements, but must packet radio always be conducted
>with the worst RF techniques possible?

Bob,
I agree with Phil's response to this and would like to make one further point.
The exact division between broadcast and point-to-point is going to depend not
only upon terrain but on desired DX and bandwidth. While one can build
big colinear arrays (or whatever) and generate pancake patterns which are omni,
at some point of narrow vertical beamwidth and DX between stations propagational
"de-steering" of the beam will end up negating further increases in the omni
antenna's gain. Not only obstructive fading (like where changes in refractive index
cause the intervening terrain to "rise up" in between to apparantly LOS stations
but also deviations from zero degree (with respect to the horizon) headings can
cause less than the full ERP to be visible to the other end. I believe there is
an example of this here locally in the form of TV channel 50. They are located at
about 4400 feet and 15 miles from local population center. This has resulted in the
need for a transmit antenna with a negative vertical angle instead of one at the horizon.
Had they opted for a lower gain antenna they would have avoided the need to steer it
off of the horizon but would of course have suffered from reduced ERP.
Holding physical aperture constant (whether an omni or a point-to-point antenna)
does offer either zero freq. dependence or 6 dB/octave improvement as Phil correctly noted
(depending on whether held for just one or both ends) but eventually hits an upper limit
at which point DX needs to be reduced to maintain performance. I think this is
generally the reason we see the phone companies limiting their microwave path length to
30 miles or so and I guess it is the same sort of reason that a telescope bigger than
a few inches in diameter doesn't make much sense for earthbound viewers.
This is why I have been concentrating on lowcost, higher datarate hardware for
amateur networking and not just high performance high bandwidth. I think we
need these things to be cheap enough to scatter them all around like popcorn to
make for a really solid network. As Phil noted, the precise separation will depend
on the area, the Rockies has well stirred air and is not the problem that the
coastal/marine areas are.

> coverage is often spotty. 902 MHz suffers from a malady not unlike 220; since
> the Japanese don't have a band there, they won't develop equipment for it.

This is the reason we have to put some pressure on the Japanese manufacturers.
Here's one way:

If you must buy a radio in a band available in Japan (e.g. 2m, 70cm, or 23cm)
then only buy those radios which ALSO have an identical model in a band that
is NOT available in Japan (e.g. 135cm or 33cm).

Buy multi-band rigs where possible (if within your budget). The hope is to
see a true multiband (6m,2m,135cm,70cm,33cm,23cm,13cm) VHF/UHF rig on the
market soon so that competition and creative engineering can get its costs
down, and we can have multi-band flexibility instead of being locked into a
single band and unable to save the other bands.

> I sincerely hope that no - code doubles or even triples the US ham population.
> The most significant impact on the rest of us would be the likely resurrection
> of Collins and Drake, who are likely to see one million hams as a "real
> market".

The increase is likely to be in the new Tech class (or in other VHF/UHF
classes depending on the license structure adopted) so Collins and Drake
will have to get into the VHF/UHF market. That won't be too hard for the
likes of Drake if the original people are involved. Drake, I believe, had
the first radio capable of 144, 220, and 440 all in one (with added modules).

>things?

Even if the X-field aerial (its a G-land idea afterall :-) is not
an April-fools day joke, doesn't it's size imply that the "gain" must
approach that of an isotropic antenna (i.e., less than that of a
1/2-lambda dipole) ?

Also, for it to work, it must obey the law of reciprocity (i.e.,
work equally well on reception). So, here is a ripe field for those
waiting for no-code licence rules to pass (:-)

I haven't been able to find the couple of X-field aerial references
cited in the article. Anyone else had better luck?

From: wjc@XN.LL.MIT.EDU
Message-ID: <1372@xn.LL.MIT.EDU>
Source record: 18941

I had been under the impression that the NOAA Weather Radio stations transmitted on either 162.400 MHz, 162.475 MHz, or 162.550 MHz. However, yesterday I discovered a Weather Radio transmission on 162.425 MHz. When the station IDed, it mentioned a transmitter on 162.475 MHz at Mt. Ascutney, VT and another on 162.425 MHz at Marlborough, VT (probably on Hogback Mtn.).

Does anyone know the entire set of frequencies used by NOAA Weather Radio? Also, does anyone have a list of the stations in New England and New York?

In article <4897@pt.cs.cmu.edu> rwb@vi.ri.cmu.edu (Bob Berger) writes:

I suggest going to horizontal polarization for such a network. Above 1 Ghz,
omnidirectional high gain antennas are actually easier to build for horizontal
polarization than for vertical polarization.

The antenna I'm referring to is called an Alford slot. It consists of a
vertical cylinder a few wavelengths long with a vertical slot cut in it. It
can be made from a piece of metal tubing.

Robert Berger, N3EMO
rwb@vi.ri.cmu.edu
--

Please forgive the ignorance: I thought I heard somewhere that this
would give you Circular polarization. Or perhaps the Alford slot was
used with a vertical element 90 degrees out for this? This was used
at 2 Gig I think.

All of this talk about crystal sets and razor blades reminded me
of an incident about 20 years ago, when I was living in Boulder,
Colorado.

I had just moved into a new apartment, and was using a razor blade
(single edge "blue blade" to scrape some masking tape off a large
window). I was standing on a chair, and was thus somewhat insulated
from the floor. Now, Boulder normally has a thunderstorm in the
afternoon on many days during the summer, and one came up while I
was working on this window (on the inside).

Suddenly a LARGE lightning bolt hit the top of the Flatirons, about
3 miles away. These are large monolithic slabs of sandstone that
were tilted up at a sharp angle when the Rocky Mountains rose. They
are about 700' high (if I remember correctly).

I received a h*ll of a jolt from that razor blade when the lighting
struck. Now this was a bit a a suprise, since although I'm familiar
with induced EMF in antenna systems due to nearby strikes, I would have
never thought that a razor blade had enough metallic area to collect
enough EMF to be perceptable. I believe it had something to do with
the fact that at that moment the blade was in contact with a large
insulator (the glass), and it rectified the current. Any comments
on this effect?

Source record: 18945

I think you will find that the Alford slot antenna suggested by
rwb@vi.ri.cmu.edu was marketed for FM broadcast use at the time of the
move to the present FM frequencies (late 40s, 50s) by RCA as the "Pylon".
A four-bay version was common. With the move to circular polarization, the
(and tower-side mounted antennas) this antenna lost its popularity for
100 MHz FM broadcasting. I seem to remember slot antennas for UHF TV.
Side-fire helixes have also been used with HIGH gains on UHF TV.

Come to think of it, maybe the Alford slot was the one sold for FM BC b
by Raytheon when they made BC transmitters. It just looked like four
pipes connected by a plate at the end of each bay, extending above the
trasmitting tower.

Side mounting requirements led to the Andrew Multi-V, and various stacked halos.
The halos are common today with canted (vertical) extension to get dual
H and V polarization.

> I have often amazed myself at how well a random long wire works as an
>SWL antenna, once outperforming a $70.00 BC SWL antenna.

All too true. When we bought the new SWL (a 2010) after my having been away from SWL for many years, I picked up Grove's active indoor antenna with pre-amp (about $90). It worked fine, but in the environment it was in (the office with the computers and printers) was also quite noisy.

One day, in a fit of boredom, I grabbed some zip wire and cut a pair of 1/4 wave longwires and stuck them onto the 2010 (one at 13 meters, one at 19 meters). Much to my surprise, the longwires (one or the other) worked as well or better than the active antenna on everything I tested it against -- and it was much less susceptible to noise.

My current antenna is simply a really long, untuned longwire wrapped around an old broomhandle -- about 300 feet worth. It is attached to the inner core of some coax and moved outside to the driveway when I'm listening (the coax is simply to keep as much of the computer RF away from the signal as possible. There's no balun or any attempt to match the coax and the giant inductor coil I wrapped....). It's significantly stronger than the tuned 1/4 waves, even putting the 1/4 waves outside. One of the things I'm considering doing after I move is putting up a really long longwire (~1000 feet or so) but I don't want to do that without proper grounding. This isn't thunderstorm territory, but there's no sense putting out a charge collector without some kind of protection when it's goig to be that big and out there permanently.

It's interesting how well fairly cheap and primitive antennas do work -- the 1/4 longwire cost about $2.00, plus connector. The inductor coil antenna maybe $10. You don't need a fancy antenna to go out and get some good DX...

phil@ux1.cso.uiuc.edu writes:
>If you must buy a radio in a band available in Japan (e.g. 2m, 70cm, or 23cm)
>then only buy those radios which ALSO have an identical model in a band that
>is NOT available in Japan (e.g. 135cm or 33cm).

I thought most radios were fairly easily converted to other bands, so just buying a particular model because it happens to have a sister model on a less-used band doesn't sound convincing. Maybe I'm wrong.

>Buy multi-band rigs where possible (if within your budget). The hope is to
>see a true multiband (6m,2m,135cm,70cm,33cm,23cm,13cm) VHF/UHF rig on the
>market soon so that competition and creative engineering can get its costs
>down, and we can have multi-band flexibility instead of being locked into a
>single band and unable to save the other bands.

One way to encourage manufactures to produce multi-band base station rigs might be to stir up more activity on, for example, 135cm, 33cm, and 13cm. We might have ATV repeaters on 13cm, say. If we encourage people to get on the air on the less-populated bands, then we might get cheaper stuff in the long run. Why don't we opt for satellites that will tranceive on 13cm? Greater gain on antennas of relatively smaller physical size might encourage people to use satellites. (Speaking of satellites, I wish amateurs had a geosynchronous satellite ... chasing Oscar was sort of hectic. I felt like a submarine captain, tracking enemy shipping! I'm sure that a geosynchronous satellite will greatly enhance the satellite-user population.)

The Japanese trend, at least for the three major manufacturers, is definitely towards multiband capability. Unfortunately, "multi-band" seems to mean 2m - 70cm - 23cm. The microwave bands (13cm, 5cm, and 3cm) aren't used much. JAs are heading to UHF for sure -- 2m and 70cm are getting to crowded -- so you can count on tri-band handhelds and mobiles appearing soon. The Icom multi-band mobile is a step in that direction. So is the Kenwood TS-790A.

Well ... the gut feeling I have is, can amateurs devise a new mode of communication that is suited especially for UHF/SHF? To explain by analogy: instead of having people move to the suburbs only because downtown is getting congested and all sorts of lids live there, why don't we make the suburbs strikingly unique and attractive, so that people who don't mind living downtown would be tempted to move out? Good news is, in radio, you don't have to move out; all you need is to get on another band. However, if you take a look at 13cm and find the same activities you find on 2m, then going out to buy a 13cm rig isn't that much appealing, is it? I can't come up with good ideas for UHF/SHF, save that if we had a geosynchronous satellite with wide frequency coverage in these bands, we could hope for long-distance high-quality communciations, and that in video, no less. We could go for a nation-wide network of repeaters, but I feel repeater networks just create

a mess (no facts to back up my impression though).

Hope you notice that I'm just thinking out loud.

SpaceNews

MONDAY MAY 8, 1989

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly
on packet radio bulletin board systems and the Unix USENET news network.
It is available around the world on many computer news systems and is available
for unlimited distribution.

* VOYAGER NEWS *

Voyager-2 is scheduled to have a close encounter with the planet Neptune at
0500 UTC on 25Aug89. W6VIO, the Amateur Radio club station of the Jet
Propulsion Laboratory in Pasadena, California, is expected to be active during
Voyager's upcoming encounter, transmitting slow-scan television pictures of
the images of Neptune received at JPL. Monitor 14.235 MHz for W6VIO during the
Neptune encounter in August.

* OSCAR-9 NEWS *

A CCD earth image was taken by OSCAR-9 on 03May89 at 08:57:45 UTC and
transmitted all day on 04May89.

Diary software reloads will take place on Tuesdays and following this, a CCD
image will be transmitted. The time the image is taken will depend on earth
illumination. During the Northern hemisphere winter months, this will either
be Tuesday or Wednesday mornings, UTC. The CCD image will be transmitted until
00:00 UTC on Thursday, when the beacon will switch to Digitalker telemetry.

The 29.510 MHz CW beacon was silent on 06May89 at 01:30 UTC.

* OSCAR-10 NEWS *

According to Peter, DB2OS, and AO-10 command station VK5AGR, OSCAR-10 is again
available for use from 01May89 until September. Due to eclipse periods, the
transponder will not be available for use between MA 226 and MA 24.
The eclipse period will end on 13Jul89, and the transponder will then be
available for use during the entire orbit. Please discontinue use if "FM-ing"
effects are noted on the beacon or transponder downlink passband.

01May89 to 13Jul89: Mode B : MA 25 to MA 225
OFF : MA 226 to MA 24 (eclipse period)
14Jul89 to Sept 89: Mode B : MA 0 to MA 255

* OSCAR-13 NEWS *

The following operating schedule for AO-13 is expected to remain in effect
until 03May89:

Mode : Beginning (MA)
------+---------------
B : 100...160
JL : 160...200
B : 200...255
OFF : 000...100

* JAS-1B *

A second Japanese OSCAR spacecraft is under construction, and is due for
launch with the MOS-1B Marine Obeservation Satellite on an H-1 rocket from the
Tanegashime Space Center at the end of January or beginning of February 1990.

The frequency allocation of transponders, beacons and modes of operations will
be similar to OSCAR-12 and will include:

JA : Uplink 145.90 - 146.00 MHz
: Downlink 435.90 - 435.80 MHz

CW Beacon -- 435.795 MHz, 1 watt output

JD : Uplink 145.85, 145.87, 145.89, 145.91 MHz
: Dwonlink 435.91 MHz

* SHUTTLE NEWS *

The following is a recent Keplerian element set for tracking ATLANTIS on
mission STS-30:

Element Set : JSC 094
Ref. Epoch : 89 125.62804418
Inclination : 28.8861
R.A.A.N. : 334.6686
Eccentricity : 3.3260E-03
Arg/Perigee : 204.1244
Mean Anomaly : 23.7676
Mean Motion : 15.85813500
Decay Rate : 5.7E-04
Orbit Number : 14

Magellan was successfully deployed on orbit 5 and is on its way to Venus.
Telemetry received from Magellan shows that all is well on the spacecraft.

The STS-30 de-orbit burn is scheduled for orbit 64 at 3 days, 23:53:00 mission
elapsed time.

* SKY WATCHING *

MERCURY is presently visible low in the western sky at sunset, but will reach
inferior conjunction on 23May and will no longer be visible this month.

VENUS will become visible at the end of this month, low in western sky after sunset. Venus and Jupiter will appear close to one another in the western sky on May 22-23 at magnitude -3.9, compared to Jupiter's -2.0 magnitude.

MARS is visible near Castor and Pollux in the constellation Gemini this month.

JUPITER is visible low in the western sky after sunset. It will be too close to the sun to be visible by the end of the month, but will re-appear by July as a "morning star".

[Information via the U.S. Naval Observatory.]

From: sampson@killer.Dallas.TX.US
Message-ID: <8027@killer.Dallas.TX.US>
Source record: 18959

The signal may be a radio station link to the transmitter. There are about 3 such signals locally that go from about 940 to 954. The signal is easily heard on the WBFM mode of my scanner, but is distorted in NBFM. Maybe this is the problem your experiancing?

I approached the manager at the booth that was "displaying" the wx stations among other "fleshly" things.... I asked him what he was selling, flesh or wx stations and told him I thought it was pretty crude to use such tactics.

I'll be the first to admit that the working models there would turn heads of any normal male. I just don't think that such methods are appropriate in a forum like that. If some private club or group wants to get off on that kind of stuff, then so be it. But there were a lot of people who weren't so impressed, including a lot of women, children and myself.

```

YAESU FT-470 and FT-411 CAUTION!!!

This is a caution for persons considering purchase of either the Yaesu FT-411 or the FT-470 handheld tranceivers.

I purchased an FT-470 Dual-Band HT from R&L Electronics at the Dayton Hamfest. This is a beautiful little radio with enough microprocessor controlled functions to rival even the largest radios. I was initially pleased with this radio while operating at Dayton. Upon returning home to the Indianapolis area, however, I was quite disturbed to hear the combination of a local repeater and the local NOAA weather radio station appearing anywhere and everywhere in the 2 Meter band. Further investigation revealed that the apparent cause is a front end mixing of the 145.25 MHz. repeater and the 162.55 MHz. weather radio. Note the difference in frequencies: 162.55 - 145.25 = 17.3 MHz. OOPS! The first IF frequency of the 2 Meter receiver in the FT-470 is 17.3 MHz! I have since talked to two other local hams who have the same model radio. They both have this problem. The interference is strong enough in the Indianapolis area to render the squelch control totally useless and to rival the signal strength of some otherwise useable repeaters. I am told that the first IF of the Yaesu FT-411 HT is also 17.3 MHz.

Since NOAA weather radio is a 24 hour/day broadcast and the wide area repeater (WA8VZY) on 145.25 MHz. is probably the busiest in Indiana, these Yaesu radios are of questionable utility in the Indianapolis area. Note that my QTH is one county North of the Indianapolis (over 20 miles from NOAA and over 30 miles from WA8VZY). I cannot use this HT on 2 Mtrs with my 11 El. yagi, regardless of where it's pointed! The interference is marginally tolerable at home when using the supplied "rubber duck" antenna.

I have contacted both R&L Electronics of Hamilton, Ohio (local Yaesu service center) and Yaesu in California. I have not received acknoledgement from either party that there is even a problem with these radios in this situation. I am still pursuing this with Yaesu but I am getting nowhere fast.

I really love this little radio but something needs to be done here! It appears to me that there is a design or alignment problem with these units which needs to be cured.

If you are considering buying one THINK AGAIN!!! If you have already bought one and are experiencing similar problems, let me know! I feel sure that if Yaesu can come up with a cure, that they will then acknowledge the problem.

Until then I guess I'll just live with the thing and stick to 440.

Mike... AB9V @ KD9QB

::::::::::::::::::::::::::::::::::
:: SWEDEN CALLING DXERS ::
:: from Radio Sweden ::
:: Number 2040--April 25, 1989 ::
::::::::::::::::::::::::::::::::::

Shortwave and other electronic media news from Radio Sweden.

This week's bulletin was written by Agnes Carbon.

Electronic Edition edited by George Wood.

Packet Radio BID SCDX2040

--------------------------------------------------------------------------

NOTE--Next week's Electronic Edition will be delayed, as I'll be in Leningrad
on my honeymoon. Hopefully you should see two editions in two week's time.
(George Wood)

SATELLITE-RADIO--Europe can look forward to a brand-new satellite-radio
service, called Super Gold-The Oldies channel. It's to begin broadcasts from
an Intelsat satellite on July 1st. Besides cable networks, the new service
will probably be picked up by Independent Local Radio stations in Britain.
(Bradley Allen, England)

SATELLITE-TV--We've reported before how the Scandinavian satellite-TV channel
TV3 won the rights to broadcast the ice hockey world championships, which are
going on now here in Stockholm. Now the newspaper "Dagens Nyheter" has
discovered how people with satellite-TV reception equipment can tune in on
the broadcasts, without having to buy decoders, which aren't on the market
anyway, and without having to watch all the commercials.

TV3 itself broadcasts from the Astra satellite. But the signal is being
relayed from Stockholm to TV3's headquarters in London using ECS-2, also
called Eutselsat F2. Anyone who tunes in there can watch the hockey, without
commercials, and even apparently watch the crew clowning around before the
broadcasts. ("Dagens Nyheter")

ALBANIA--Radio Tirana uses now only two SW frequencies for its half hour
German broadcasts: 7310 and 9373 kHz (along with MW 1458 kHz evenings). The
times are 04:00, 12:30, 14:00, 16:00, 19:30 and 21:00. (Wolfgang Gruschel,
West Germany)
```

AUSTRALIA--Updating SCDX-2039, Radio Moscow has stopped interfering with Radio Australia on 9655 kHz at 07:00-10:30. Reception is still bad Sundays until 08:55 because Radio Sofia uses the frequency for Serbo-Croatian and Greek. (Volker Wachtendorf, West Germany)

AUSTRIA--RAI's DX show in German "Kurzwellen-Panorama" is to be broadcast Saturdays at 05:05, 08:05, 11:05, 14:05, 17:05 and 20:05 on 6155 kHz (13730 kHz at 05:05, 08:05 and 11:05). (Helmut Zastrow, West Germany)

AUSTRIA/CHINA--A delegation from Radio Austria International went to China on the invitation of Radio Beijing and the Chinese government to inspect transmitter and relay station sites for a possible exchange of broadcasting hours and relay co-operation agreement. Austria is especially interested in improving reception of shortwave programmes from Vienna in the South East Asian and Pacific regions. Radio Beijing has already concluded relay agreements with Switzerland, Canada, Mali and Spain. (BBC Monitoring)

BELGIUM--BRT has added the new frequency of 9925 kHz for its morning program in German weekdays 08:30-08:55. 6035 and 11695 kHz remain in parallel. (Wolfgang Gruschel, West Germany) The national radio news bulletin in German is broadcast to Europe and Africa over RTBF at 10:30-10:45 on 9925 and 25645 kHz. (Wolfgang Gruschel, West Germany)

BURUNDI--Radio Burundi has been heard testing on 6190 kHz at 17:00. (Marcel Rommerts, Netherlands)

CUBA--Since March 27th, the Havana tourist radio station Radio Taino has announced only 1160 kHz. 830 kHz is no longer announced or observed, though the station continues to use an additional unannounced transmitter on 1040 kHz irregularly. (BBC Monitoring)

FRANCE/GABON--According to an observation made on April 8 at 19:35, Radio France International has changed its frequency from Gabon from 4890 to 4860 kHz. Parallel frequencies were 6175, 7160 and 9760 kHz. (Gerhard A. Werdin, West Germany)

WEST GERMANY/SRI LANKA--The Deutsche Welle relay in Trincomalee will start operating again from May 1st. In German 07:00-14:00 on 21640 kHz, 17:00-18:00 on 21560 kHz, 22:00-24:00 on 11785 kHz, 10:00-14:00 and 17:00-18:00 on 1548 kHz. In English 02:00-02:50 on 1548, 9615 kHz and 11835 kHz; 09:00-09:50 on 11945 and 17875 kHz and 16:00-16:50 on 1548, 6170 and 7225 kHz. (S. Umakanthan, Sri Lanka).

HAITI--On April 6th the Haitian national guard took a number of radio stations off the air by damaging or cutting off their antennas. According to one report, people were wounded at some of the stations. At Radio Liberte soldiers are said to have totally destroyed the transmitter as well, while at Radio Antilles International palace soldiers took away transmitting equipment while a gun was held to the head of a watchman. Only four stations (the official Radio Nationale, the private Arc-en-Ciel, the Catholic Church's Radio Soleil and protestant Radio Lumiere) continued operations. (BBC Monitoring)

IRAQ--Radio Baghdad now uses 11800 kHz for its English broadcast to South Asia at 01:30-03:30, jamming the SLBC's Hindi transmission to South Asia on the same frequency. (Kanwarjit Sandhu, India and Cosimo Cannata, Italy)

ITALY--According to a QSL letter, Radio Europe in Milan broadcasts daily at 08:00-10:00; Tuesday to Friday on 27827 kHz and Saturday, Sunday and Monday on 7295 kHz. (Hans-Dieter Buschau, West Germany)

SOUTH KOREA--Radio Korea will have some new broadcasts in German from May 1 at 11:00-11:45 on 13670 kHz. The English program at 06:00 to North America will move from 6060 to 11830 kHz and Spanish at 01:45 will be beamed to Africa and the Middle East on 6165 kHz. (Herbert Aichele, West Germany)

NETHERLANDS ANTILLES--Updating SCDX-2029 TWR's DX program "Bonaire Wavelength" is aired Sundays and not Saturdays, on 9035 and 11930 kHz at 03:30. (Volker Wachtendorf, West Germany)

PAKISTAN--Updating SCDX-2039, Radio Pakistan's English slow speed new broadcasts use 21575 kHz at 11:05-11:20. (A.E. Broadsmith, England)

UNITED STATES--Greenpeace has started broadcasts in English via KUSW in Salt Lake City. The frequency is 15650 kHz and the broadcasts are Mondays and Thursdays at 18:30, Tuesdays and Fridays at 19:30, Wednesdays and Saturdays at 17:30 and Sundays at 19:15. (Henrik Karlsson, Sweden)

Updating SCDX-2038, the new Christian Science Monitor station WSHB in South Carolina is also broadcasting to Australia at 08:00-10:00 hrs on 17855 kHz. (BBC Monitoring)

The Christian Science Monitor has had to fire all but a handful of the employees working for Monitor Radio and its shortwave World Service. This is because of the financial burden of developing a daily television news program. From May 1st there will be a new consoldiated program on shortwave, run simultaneously from the transmitters in Maine, South Carolina and Saipan. (Radio Netherlands "Media Network")

USSR--Radio Vilnius in Lithuania has a new schedule in English: at 21:30-22:00 on 666 and 6100 kHz and 22:00-22:30 on 666, 6100, 7400, 9765, 9860, 15240, 15455 and 17665 kHz. On Mondays and Thursdays at 22:00, there is now a 4 minute Esperanto transmission.

VENEZUELA--Radio Mara, Maracaibo was heard from around 09:00 until 04:00 on 3275 kHz. (Franz J. Bartel, Venezuela)

ZAIRE--Radio Bukavu was heard on 4860 kHz in French at 03:40. (Hans-Dieter Buschau, West Germany)

UNOFFICIAL RADIO--A station identifying itself as Radio Siboney, the Voice of the Cuban exiles, was observed on March 5th from 17:30-18:27 on 6100.2 kHz. It is believed to be named after a Cuban popular song and addresses itself to Cuban forces in Angola. (BBC Monitoring)

Sweden Calling DXers is the world's oldest radio program for shortwave listeners. Radio Sweden has presented this round-up of radio news, features, and interviews on Tuesdays since 1948. RS broadcasts to North America:

15:30 hrs on 17880 and 21610 kHz
03:00 hrs on 9695 and 11705 kHz

To Europe, Africa, and the Middle East:

17:00 hrs on 1179, 6065, and 9615 kHz
21:00 hrs on 1179, 9655 and 11705 kHz

And to Asia and the Pacific:

12:30 hrs on 17705 and 21610 kHz
14:00 hrs on 17705 and 21610 kHz
15:30 hrs on 17705 kHz
01:00 hrs on 15390 and 17790 kHz

The Radio Sweden schedule to Europe can be found on Sky Channel's teletext Service, Sky Text, on page 496.

The Electronic Edition is based on the Sweden Calling DXers bulletins which are mailed out every 4 weeks to contributors. Contributions can be sent to DX Editor George Wood to Swedish telex 11738, CompuServe (via the HamNet Forum or Easyplex 70247,3516), through the FidoNet system to 2:501/297 or to SM0IIN at the packet radio BBS SK0TM.

Reports can also be sent to:

Radio Sweden
S-105 10 Stockholm
Sweden

Contributions should be NEWS about electronic media--from shortwave to satellites--and not loggings of information already available from sources such as the "World Radio TV Handbook". Clubs and DX publications may reprint material as long as Sweden Calling DXers and the original contributor are acknowledged, with the exception of items from BBC Monitoring, which are copyright.

We welcome comments and suggestions about the electronic edition, Sweden Calling DXers, and our programs in general.

Thanks for 45 contributors this week Good Listening!

737. Headset for hang gliding question

Newsgroup: rec.ham-radio
Date: 1989-05-06 18:58:59 UTC
From: philb@ptolemy.WV.TEK.COM
Message-ID: <11374@tekecs.GWD.TEK.COM>
Source record: 18962

Another question about headsets: I'd like to use may handheld
when I'm hang gliding, however, I need a headset (with vox) that
can handle up to 45 mph winds and still be intelligable. Anyone
know of a headset that will work in this environment? How about
modifying one to work correctly? Any chance I can use a
Plantronics Starset?

Thanks

Phil Biehl, N7FWL

738. NOAA WX freqs

Newsgroup: rec.ham-radio
Date: 1989-05-06 20:19:23 UTC
From: ST7501@SIUCVMB.BITNET
Message-ID: <8905070711.AA12034@ucbvax.Berkeley.EDU>
Source record: 18969

There are seven frequencies that NOAA uses. They are:

(1) 162.550 Mhz
(2) 162.400 Mhz
(3) 162.475 Mhz
(4) 162.425 Mhz
(5) 162.450 Mhz
(6) 162.500 Mhz
(7) 162.525 Mhz

I believe these are listed in order of most to least used.

Hope this helps,
DE KB9ANK

739. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1989-05-06 21:16:18 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <8905090740.AA18184@ucbvax.Berkeley.EDU>
Source record: 18955

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

740. Re: strategies for more VHF/UHF rigs (was: Re: Why Not 1.2gHz?)

Newsgroup: rec.ham-radio
Date: 1989-05-06 21:42:15 UTC
From: paulf@Jessica.stanford.edu
Message-ID: <2091@Portia.Stanford.EDU>
Source record: 18956

In article <8844@csli.Stanford.EDU> kawai@csli.stanford.edu (Goh Kawai) writes:
>I thought most radios were fairly easily converted to other bands, so just
>buying a particular model because it happens to have a sister model on a
>less-used band doesn't sound convincing. Maybe I'm wrong.

Most radios are "rubberized" to within +-10% of their manufactured center
frequency. Getting beyond that basically involves redesigning the RF
deck, which is possible but not trivial.

GRE of Japan already makes a nice "all VHF - UHF" receiver (the PRO-2004 and
succesors); an all band transmitter isn't that much more difficult. But
the manufacturers would rather have you buy a rig for each band, than one
unit.

>One way to encourage manufactures to produce multi-band base station rigs
>might be to stir up more activity on, for example, 135cm, 33cm, and 13cm.

Chicken and Egg problem. No equipment, no activity, ergo no equipment...

>Why don't we opt for satellites that will tranceive on 13cm?
>Greater gain on antennas of relatively smaller physical size might encourage
>people to use satellites. (Speaking of satellites, I wish amateurs had a
>geosynchronous satellite ... chasing Oscar was sort of hectic. I felt like
>a submarine captain, tracking enemy shipping! I'm sure that a geosynchronous
>satellite will greatly enhance the satellite-user population.)

We're headed in that direction, generally, but that takes time and money.
AMSAT Phase IV is a geosync bird, but we havn't quite figured out yet how
to fund and staff the project (which will be much more costly and time
consuming than any previous satellite project).

>Well ... the gut feeling I have is, can amateurs devise a new mode of
>communication that is suited especially for UHF/SHF? To explain by analogy:
>instead of having people move to the suburbs only because downtown is getting
>congested and all sorts of lids live there, why don't we make the suburbs
>strikingly unique and attractive, so that people who don't mind living
>downtown would be tempted to move out?

I guess you could say, using your analogy, that ham radio is the "low rent"
district of telecommunications. Simple economics keeps people where they
are; why buy a $400 1.2 GHz handheld if I can buy a 2m rig for $125?

The good news on this front is that UHF / SHF gear is getting cheaper, at
least on the component level. Even then, however, coverage on SHF is spotty
without multiple recieve / transmit sites.

What is needed at the moment is a bare - bones (even rockbound) 900 MHz HT. It's silly to have all of the scanning - memory - synthesizer gadgets on a band as sparsely populated as 1200 or 900. You can make arguments for moving upward in frequency 'till the cows come home, and talk yourself blue in the face, but it won't have nearly the effect of cheap equipment...

> This isn't quite the case. The Japanese certainly *do* have a band at 903 MHz
>(maybe that isn't what you meant). It is basically the equivalent of our CB but
>runs 5-10W and NBFM.

I recently dug through a copy of _CQ Ham Radio_ (graciously supplied by Goh Kawai), looking for 900 MHz equipment. A few companies do offer stuff for the 903 band; however it's a cellular radio system, (TX is about 890 MHz), so the rigs would require some modification. I'm planning on making a run to Akihabara late this summer, so I'll probably drag a few rigs back.

Components for SHF are getting cheaper, and more prevalent, no denial there. But very few hams have rf design skills, and even fewer have the time to hack rigs together.

742. Where to get the latest KA9Q Software...

Newsgroup: rec.ham-radio
Date: 1989-05-06 23:55:02 UTC
From: howardl@wb3ffv.UUCP
Message-ID: <10089@wb3ffv.UUCP>
Source record: 18968
Cross-posted to: rec.ham-radio.packet,rec.ham-radio

Hello,

It has been a while since I have posted this information, and with the NEW release of the KA9Q TCP/IP Software I felt I should probably do it again! Here is the information on how to retreive the latest bits from the WB3FFV telephone based bulletin board. PLEASE don't leave me a ton of Email, as I don't have much time to reply...

+--+
HOW TO ACCESS THE WB3FFV AMATEUR RADIO TELEPHONE BBS !!!

I have placed a BBS system on-line that is mainly oriented towards the Amateur Community (but there is other stuff on-line). As of now I have not attempted to promote this system any place except in the amateur channels (PACKET, USENET, & word of mouth), and will continue under this policy, as I hope to keep it oriented toward amateur radio. The various software for UP/DOWNload is available via telephone dialup and Packet TCP/IP, and through user support I hope to keep the latest and greatest ham software on-line. Below is the information that is needed in order to access the BBS via Telephone -or- TCP/IP, please pass it around to as many ham's as possible.

System Name: WB3FFV
Login: bbs
Number: (301)-335-0858 -- 1200 & 2400 (Non-MNP)
Number: (301)-335-1955 -- 2400 (MNP), 9600 & 19200 (PEP)
Data Settings: 8 Bits, NO Parity, 1 Stop Bit
Times: 24hrs/365days (except for routine maintenance)
Software: XBBS (UNIX/Xenix Multiuser BBS)
IP Address: 44.60.0.1 {wb3ffv.ampr.org} [for FTP access on 145.550 mhz ONLY]
Misc. Info: Machine is an 80386 computer running UNIX V.3.2 and features 300+ meg of on-line storage. Most transfer protocols are available!!

I attempt to keep the latest and greatest HAM software on-line, and encourage all to upload anything new that they come up with, as it is of benefit to all. Here is a sample of a couple pieces of software that is available for DOWNLOAD:

KA9Q TCP/IP Software for the PC (Latest OFFICIAL release + TEST Versions)
KA9Q TCP/IP for the Atari-ST, MAC, & Amiga
KA9Q TCP/IP for UNIX based systems
WA7MBL BBS for the PC (Versions 3.31, 4.31 & 5.12)
W0RLI BBS for the PC (Versions 6.xx, 7.xx, 8.xx, 9.xx)
Various BBS utilities and enhancements
Several MORSE CODE Tutors
TheNet software by NORD><LINK (Version 1.01)
Modifications for many HAM Rigs and Scanners

Digital Signal Processing software (DSP)
DX and contesting programs
ARRL Newsletters & Gateway
W5YI Electronic Edition

There is much more available on the BBS, and I don't want to waste a lot of PACKET BBS space trying to list it all, so if you are interested give it a call and see for yourself !!!

For anybody that desires to use UUCP for file transfer, use a login of uucpanon and no password!

P.S. - This system will be kept current within several days when it comes to the TCP/IP software, as I am trying my best to promote IP in the PACKET community...

743. Stereo AM radio

Newsgroup: rec.ham-radio
Date: 1989-05-07 00:02:10 UTC
From: joel@xrtll.UUCP
Message-ID: <292@xrtll.UUCP>
Source record: 18972

I thought I would just put my two cents in about this AM stereo radio.
I stop listening to AM back in 1975 and never went back.
I feel FM has more to offer, I do have AM stereo inthe car, It came
with the system, sure it sounds like stereo, but it still sounds
like AM, with all its cracks and other interference, FM is the only
thing I listen to.
I guess I would have to say that in our city, we are kind of lucky as we
have so many stations in both bands and they all boost alot of power that
I can travel as far as 100miles and still get a good signal from most stations.

BUT FM lives and my AM stereo button will collect dust for ever.

Speaking of that AM stereo button, Why have one? If the station is stereo, then
it should go on, why would anyone turn it off?

P.S. I would place a closing address here, but I'm not sure what it is, this is
my first message on here.

Joel..

744. Headset & Earphone Laws

> don't know what this means.)
*
Well, this unfortunately means that they don't allow them at all. A radio
club I used to be secretary for had a big fight with the cops about the
use of headsets that even only covered one ear and had boom mikes on them..
So basically this means that Illinois doesn't let you use headsets. As I
recall there was legislation pending last session of the General Assembly
to change this ... but then I went away to college....

745. Goddard rebroadcast of shuttle

Newsgroup: rec.ham-radio
Date: 1989-05-07 05:29:34 UTC
From: msmith@police.rutgers.edu
Message-ID: <May.7.01.29.27.1989.826@police.rutgers.edu>
Source record: 18967

Kudos go to the Goddard Amateur Radio Club for rebroadcasting the
shuttle audio during the flights.

However, many SWL's out there, who are not hams, do not have SSB
equiptment. Would it be possible for the Goddard club to broadcast on
one or two bands (preferably around 7.25, or 21.40 Mhz) in a mode that
we can receive with a low-end receiver, such as the Emerson PSW-4010?

Mark

747. The Great Bash NSTC Color Debate.

Newsgroup: rec.ham-radio
Date: 1989-05-07 13:03:29 UTC
From: rc@CMR.ICST.NBS.GOV
Message-ID: <8905071303.AA05307@cmr.icst.nbs.gov>
Source record: 18961

As has been said before, NTSC color suffers from being first. BTW, what has happened to the GE receivers that did phase correction in the home based on the vertical interval test signal (line 22???)? That should allow NTSC to have most of the stability of PAL without the video delay line and loss of vertical resolution.

As for SECAM: of course it works on monochrome receivers! I think we have been seeing a bit of unfair SECAM-bashing here. While one wouldn't choose to go with SECAM today, it does work well in the viewer's eyes. The French, as the Brits, started with low definition TV, 415 lines. Then they went to 819 lines, 50 fields. All of their color has been on th 625,50 standard, and the 819 line B&W has been gone for quite some years now. The low VHF channels it was on now have 625 line service. Since France has 6 nation-wide TV channels-nets-programmes, "everything" had to be used for TV.

At least there are a few Fs on six meters, though with very limited power and restricted geographical areas. Remember that France is the largest entirely European country (ie. Russia is larger!), roughly 750x600 miles.

I complain about the flicker on European TV set (in Europe).

73, Bob, W3OTC

748. Dual-Band HT (144-440) Info Request

Newsgroup: rec.ham-radio
Date: 1989-05-07 17:02:44 UTC
From: mmullica@SADIS01.AF.MIL
Message-ID: <8905111412.AA25187@sadis01.af.mil>
Source record: 18971

ATTN: DUAL-BAND HT OWNERS!

I'm in the market for a dual-band HT and want to know if any of
y'all have had any experience, good or bad, that I may profit from?

I'm leaning toward the YAESU FT-470 because of its price, size, memory
management features and autopatch auto-dialer. Also looking at ICOM's
IC-32AT and the new KENWOOD TH-75A. The FT-470 is the least expensive
of the three (I found a source that quoted me $479). I've always been
an ICOM-man in the past, but I have an open mind.

Candid owner/operator comments are what I'm looking for. If you had
it to do all over again...which rig (if any at all) would you go with?
Any regrets in going dual-band on a HT platform? Etc., etc., etc.

With the price of these rig's being what they are, I need to do it
right the first time!

THANKS!

Martin Mullican,
Kelly AFB MARS (AGA4KE)
San Antonio, TX

749. Where to put a rig in a Jeep Cherroke ?

>operations on the "standard" bands (2m, 220 and 70cm) as well as the
>less populated UHF bands (33cm and 23cm).

I'm not arguing that new modes should be restricted to the higher bands exclusively (with the possible exception of ATV). What I am saying is that, if people are dissatisfied with the amount of spectrum available on the lower bands, that they have another option, and should exercise that option.

>There must clearly be a fair and balanced distribution of packet
>activity across the various VHF/UHF bands. I encourage anyone who can to
>abandon 2m voluntarily for serious packet operations, but at the same
>time I will fight to preserve space for those who cannot move. I should
>point out that it was my own belief in the use of frequencies above 2m
>that led to the confrontation regarding 220 MHz that I mentioned
>earlier. Nor is 70cm exactly wide-open in many areas; if anything, it is
>even less efficiently used than 220 MHz. Lightly-used private
>"ego-machines" are everywhere. Together with the biggest bandwidth
>squanderer of them all (fast-scan TV), there isn't a lot of room left
>for much else.

I'll agree about fast-scan ATV; the position of the US ATV Society (? - they publish an ATV newsletter) is especially unsupportable. They want all of the 70 cm band, from 420 to 444 MHz. Forget about the weak-signal stuff between 432 and 436 MHz, and the repeaters from 442 to 444.

220 MHz is a special case, involving government intervention.

The problem is that you want us to make repeaters unusable, if not shut them down entirely. We don't have that power.

>In short, I'm willing to do my part to encourage the packet community to
>use its allocations more efficiently and to move to less congested bands
>whenever possible. In return I think I'm entitled to something more than
>foot-dragging and hand-wringing from the frequency coordinators.

I think I'm doing as much as I can, given the realities of the situation. Don't forget that I'm a packet user as well, and would love to see it thrive and reach its full potential.

We're not living in a technical utopia, where efficiency is the only criterion. We're living in the real world, where problems are often not

technical, but political.

752. Eico Grid-dip meter

Newsgroup: rec.ham-radio
Date: 1989-05-07 23:53:50 UTC
From: Michael_Edelman%Wayne-MTS@UM.CC.UMICH.EDU
Message-ID: <140697@Wayne-MTS>
Source record: 18777

Picked up an Eico grid-dip meter at an estate sale the other day; I believe it's a model 710. Seems to work well at HF, but it's very twitchy in the 100-200MHz range. Is this typical? I'd also appreciate a copy of the schematic if anyone has one available. For $30 it seemed a reasonable deal.

SpaceNews

MONDAY MAY 8, 1989

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly
on packet radio bulletin board systems and the Unix USENET news network.
It is available around the world on many computer news systems and is available
for unlimited distribution.

* VOYAGER NEWS *

Voyager-2 is scheduled to have a close encounter with the planet Neptune at
0500 UTC on 25Aug89. W6VIO, the Amateur Radio club station of the Jet
Propulsion Laboratory in Pasadena, California, is expected to be active during
Voyager's upcoming encounter, transmitting slow-scan television pictures of
the images of Neptune received at JPL. Monitor 14.235 MHz for W6VIO during the
Neptune encounter in August.

* OSCAR-9 NEWS *

A CCD earth image was taken by OSCAR-9 on 03May89 at 08:57:45 UTC and
transmitted all day on 04May89.

Diary software reloads will take place on Tuesdays and following this, a CCD
image will be transmitted. The time the image is taken will depend on earth
illumination. During the Northern hemisphere winter months, this will either
be Tuesday or Wednesday mornings, UTC. The CCD image will be transmitted until
00:00 UTC on Thursday, when the beacon will switch to Digitalker telemetry.

The 29.510 MHz CW beacon was silent on 06May89 at 01:30 UTC.

* OSCAR-10 NEWS *

According to Peter, DB2OS, and AO-10 command station VK5AGR, OSCAR-10 is again
available for use from 01May89 until September. Due to eclipse periods, the
transponder will not be available for use between MA 226 and MA 24.
The eclipse period will end on 13Jul89, and the transponder will then be
available for use during the entire orbit. Please discontinue use if "FM-ing"
effects are noted on the beacon or transponder downlink passband.

01May89 to 13Jul89: Mode B : MA 25 to MA 225
OFF : MA 226 to MA 24 (eclipse period)
14Jul89 to Sept 89: Mode B : MA 0 to MA 255

* OSCAR-13 NEWS *

The following operating schedule for AO-13 is expected to remain in effect
until 03May89:

Mode : Beginning (MA)
------+---------------
B : 100...160
JL : 160...200
B : 200...255
OFF : 000...100

* JAS-1B *

A second Japanese OSCAR spacecraft is under construction, and is due for
launch with the MOS-1B Marine Obeservation Satellite on an H-1 rocket from the
Tanegashime Space Center at the end of January or beginning of February 1990.

The frequency allocation of transponders, beacons and modes of operations will
be similar to OSCAR-12 and will include:

JA : Uplink 145.90 - 146.00 MHz
: Downlink 435.90 - 435.80 MHz

CW Beacon -- 435.795 MHz, 1 watt output

JD : Uplink 145.85, 145.87, 145.89, 145.91 MHz
: Dwonlink 435.91 MHz

* SHUTTLE NEWS *

The following is a recent Keplerian element set for tracking ATLANTIS on
mission STS-30:

Element Set : JSC 094
Ref. Epoch : 89 125.62804418
Inclination : 28.8861
R.A.A.N. : 334.6686
Eccentricity : 3.3260E-03
Arg/Perigee : 204.1244
Mean Anomaly : 23.7676
Mean Motion : 15.85813500
Decay Rate : 5.7E-04
Orbit Number : 14

Magellan was successfully deployed on orbit 5 and is on its way to Venus.
Telemetry received from Magellan shows that all is well on the spacecraft.

The STS-30 de-orbit burn is scheduled for orbit 64 at 3 days, 23:53:00 mission
elapsed time.

* SKY WATCHING *

MERCURY is presently visible low in the western sky at sunset, but will reach
inferior conjunction on 23May and will no longer be visible this month.

VENUS will become visible at the end of this month, low in western sky after sunset. Venus and Jupiter will appear close to one another in the western sky on May 22-23 at magnitude -3.9, compared to Jupiter's -2.0 magnitude.

MARS is visible near Castor and Pollux in the constellation Gemini this month.

JUPITER is visible low in the western sky after sunset. It will be too close to the sun to be visible by the end of the month, but will re-appear by July as a "morning star".

[Information via the U.S. Naval Observatory.]

754. ANARC SWLnet APRIL loggings

Newsgroup: rec.ham-radio
Date: 1989-05-08 03:20:02 UTC
From: kingdon@cunixc.cc.columbia.edu
Message-ID: <1489@cunixc.cc.columbia.edu>
Source record: 18778

Here is the April loggings of the ANARC SWLnet. I received quite a few
replies from my last post, and have decided to keep posting the list.

This list is crossposted from CompuServe without permission of CompuServe or
the ANARC SWLnet. Hope you find it useful
Have fun!

Message-ID: <5202@ncrwic.Wichita.NCR.COM>
Source record: 18785

There was a posting a few weeks back on j-pole antennae. I bought some foam core twin lead from r.s. and was wondering if there might be a difference in velocity factors from the cheap stuff that would require dimensional changes for proper tuning. Thanks for any replied, direct or posted. Ken N0ITL

OK, a silly question maybe, but how to I translate this two
line notation into the keplerian data need for quiktrak? I can figure
out a few items, but get lost trying to get the rest.

TS Kelso periodically sends out a description of the NASA format,
excerpted below. There are programs that will read this format and
update the quiktrak files automatically. One I wrote, is called
epoch. I can send the source code (in C) to anyone email or on a SASE
disk to:
Johnathan Vail, N1DXG
RR1 305 Johnson Corner Rd
Lyndebouough NH, 03082

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical
to that used by NASA and NORAD. The format description is:

Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;

blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)

Line 3
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Note that the International Designator fields are usually blank, as issued in
the NASA Prediction Bulletins.

758. Guide to hamfesting for beginners

Newsgroup: rec.ham-radio

Subj: Tips for the Hamfester!
Thought this article was worth sharing. Excerpted from the
Chenango Valley ARA newsletter the "Bullthistle Bugle" May 1989
issue. de WB2ACV @ WB2ACV

TEC TOPICS: by Don Russ, N2CZL

There are many reasons to go to a hamfest. The origin of the hamfest was to get hams together to swap rigs, parts and money. Lately thou there are many more reasons to go. There are lectures, presentations, manufacturers representatives, retail sales, auctions, contests, licence tests, ARRL booths, club booths, ECT. I have even witnessed people leaving without buying anything but the admission and a burger! But I'm a purist. None of that before 10 O'clock. I'm there for serious reasons. I have made it best known talent. To get that bargain! And there are a lot to be found.

The best way to get the bargains is to have a plan of attack. The most vulnerable time for a person selling junk, I mean equipment, is when he is unloading it from the car. Then he is busy, distracted, and anxious to make the first sale. In many cases he hasn't thought of what he wants to ask for the thing in your hand and will take an off the cuff offer. This means you should be there first in line. This also guarantees that you get the "I have no idea what this thing-a-ma-jig is so it's fifty cents" type of bargains before someone else does. I have bought fifty dollar tools and parts that way. The best plan of attack is to skim the tables for this type of deal first. Most of my real buys occur an hour before the official start time. Ignore the tables with established parts inventories and 100 pieces of each part, they will be there later. Concentrate on the newcomers and the small tables first and then clean up the rest later.

After the tables have been scanned go back for the "truffles" run. This is where you rout through every box and bag of junk on the site. Look through the 10 cents each box (Molex extractor $25.00, alignment tool $5.00) and the old junk boxes. (6CW4 new in box, variable caps for antenna tuner.) Look for small things under or in larger things. (4 voltage switching supply in old computer cabinet for $1.00, SSI204 touch tone decoder with crystals and a Z-8 controller in a dirty, scuffed cabinet, $50.00 dollar value for $5.00) Look at everything and never ask the

question "What do I need this for?", ask "What can I use this in?" These seem to be the same questions but they are totally different. Also go back to the area where the latecomers are to catch the stuff coming out of the trunk.

Around 10 O'clock you can take it easy and catch some of the other events and displays. Look at the parts tables and professional tables around the fest. Also grab some of the free literature and advice that you can get form the league and other organizations. Grab a burger and seltzer and then do the clean-up round.

The clean-up round involves going to the tables that are packing up and giving the last minute offers. I got a great letter quality printer for my computer buy holding a conversation with the guy while he was in the process of putting it into his trunk. About the time he was about to herniate or burst a vessel he dropped the price to $25.00 and dropped it in my arms as he collapsed. The last minuet deal is the best time for the higher priced items. Some guys are counting on selling a rig to buy a new one at the retailers booth. They might make up the difference out of pocket. Never under-estimate the urge to fiddle with a new piece of equipment. This is also a good time to get free junk. Some people drop the prices to zero just so they don't have to look at it again. Bring a set of tools and scrap it there! Look in the garbage cas. You'll find that some junk was just plain thrown out. Cut out the resistors and caps, remove the switches and knobs and leave the carcasses behind.

When you are in the process of making a deal ask questions, "Are there any minor problems?", "Has it ever been repaired?", "Why are you selling it?", "Where are the manuals?", "What is your call?" If you catch him in even a minor slip of the lip don't trust him. I have been given some real strange stories. If you have his call or address you can get in touch with him later. Get his address from the call book and then ask directory assistance for his number. If you can try it out, do it! Go inside and get 110 AC. If it's a rig you should hear signals if you touch the antenna connector. Try transmitting into nothing for a second. If the rig is any good it'll try to put out power. If it's a 12 volt rig pop your hood and tie it in! Computer gear should give a raster on the screen at least. I tried a LASER that was supposed to work and it didn't. The guy knocked the price to $15.00 and I found a new tube for $20.00. The original price was $50.00.

Homemade equipment has a wealth of parts. This area has a lot of industry that dabbles in computers and such so you sometimes see the prototypes at the fest. These are great for parts and such. Grab a box and sit in front of your TV while un-wrapping some wire wrap. One $1.00 box can give you : 35 wire-wrap sockets at $0.50 each, a proto board for $17.00, a power supply, BNC connectors, caps and resistors, standoffs, cabinet, switches, lamps, IC's and such. If you were to buy these separately it would cost hundreds!

Home-made parts are usually the kind of parts you want anyway, so
these are the best sort of things to buy for parts.

But the most inportant thing to remember is to
have fun!
See you at the Fest!

(multi-band radio discussion deleted)

>The Japanese trend, at least for the three major manufacturers, is definitely
>towards multiband capability. Unfortunately, "multi-band" seems to mean
>2m - 70cm - 23cm. The microwave bands (13cm, 5cm, and 3cm) aren't used much.

For one relatively simple multi-microwave band solution see my HR magazine
series in Feb/June/October 1988 showing a 1296/2304/3456/5760 and 10368 MHz
phaselocked multiband transverter system.

>
>Well ... the gut feeling I have is, can amateurs devise a new mode of
>communication that is suited especially for UHF/SHF?

Yes! It is called a real network! A suitable network protocol designed to
automatically (invisibly to the user at least) route information "to where
it is supposed to go" over a system of point-to-point hardware operating at
higher speeds on one or more of the above bands could make efficient use
of the spectrum and the hardware. Multi-Megabaud speeds are not difficult
or expensive (see my $100-per-end 2-10Mbaud 10GHz packet link recently demo'd
at Dayton) and the point-to-point nature of the hardware combined with the
route-it-where-it-should-go software is capable of shipping large amounts of
data around quickly and efficiently.

> To explain by analogy:
>instead of having people move to the suburbs only because downtown is getting
>congested and all sorts of lids live there, why don't we make the suburbs
>strikingly unique and attractive, so that people who don't mind living
>downtown would be tempted to move out?

Agreed! As there are fewer and fewer who are excited about the glow of 4-1000
filaments and more and more newcomers interested in computer sciences don't
we have to offer something of interest if we are maintain the hobby? In the
information age doesn't this have to do with the rapid communication of
information (as opposed to 75 Meters (:>)) ?

> Good news is, in radio, you don't
>have to move out; all you need is to get on another band. However, if you
>take a look at 13cm and find the same activities you find on 2m, then going
>out to buy a 13cm rig isn't that much appealing, is it? I can't come up
>with good ideas for UHF/SHF, save that if we had a geosynchronous satellite
>with wide frequency coverage in these bands, we could hope for long-distance
>high-quality communciations, and that in video, no less. We could go for
>a nation-wide network of repeaters, but I feel repeater networks just create
>a mess (no facts to back up my impression though).
>

>Hope you notice that I'm just thinking out loud.

Thanks for thinking aloud, we need to all get together in changing things if
we are to avoid perishing as a hobby. This is a good place to start.
A nationwide digital network should not be considered as "just a computer
thing" either. At present we are working toward tieing together a portion
of Northern California with 500+Kbaud hardware to start to discover and
demonstrate some of the possibilities. While we are presently running
TCP/IP, a networking protocol, on standard AX.25 packet radio and the
current applications are primarily computer oriented; electronic mail, file
transfer, keyboard-to-keyboard, callbook servers and so on, as we get
some tolerable speeds more general applications can be run. I am hoping
that we can have a network which can support digitized voice and perhaps
slower speed video/graphics before too long.
One of the attractions of this approach is that individuals and local groups
can build their own hardware and applications and add them to the network
as they do. In such a situation both sides benefit. The local group becomes
connected to the resources of the network and the rest of the network gets
in touch with more applications and resources.
This room for expansion fits well with the satellite links you mention.
The hardware for these kinds of speeds and packet switching is really
not expensive and I suspect that if one tenth of the present TNC owners were to
commit as much to implementing such a network as they have for their current
packet operation that we could have a fairly interesting network.
I suppose we will always have the differences of opinions and approach as
to what is the right hardware, software etc and that hams will be "doing
it my way". This will no doubt continue to cause problems but I suppose
it is also part of the fun. Even so, if we can find means to cooperate and
inter-connect these divergent approaches there may still be room for everyone.
I may not grow tired of the excitement of playing with RF/microwave hardware
and my kids (and any other potential new amateurs) may never feel it
about space shots and man-on-the-moon but possibly we could both be interested
in a network offering worldwide file servers/operating systems supporting
audio, video and other information. Non-techie amateurs should still find
a depth and breadth of contesting and social possibilities available too.

Just thinking out loud too.

> Does anyone have any bright ideas where to mount a UHF single
> bander (Kenwood TM-421) in a Jeep Cherroke ? I can see several
> possibilities but would appreciate any input I can get.

I have a TM-2530 mounted on the passenger side of the gearbox hump.
The mount for this rig is the clamp and lock type so that helps.
The mount is upside down, and is bolted under the gearbox hood.
The radio has the bottom side facing the mount. I also have a TM-3530
piggy-backed onto the TM-2530 using a pair of angle brackets and
four metric screws. The TM-3530 is not secure.

> Information including where you picked up power would be most
> useful !.

Because power levels were not too high, I pulled power from the fuse
block directly. I didn't make the attachment and am not sure exactly
where they are attached on the block. One radio shuts off when I turn
off the engine and the other stays on.

761. TM-721A UHF Extend Mod

Newsgroup: rec.ham-radio
Date: 1989-05-08 18:53:03 UTC
From: flloyd%crank@Sun.COM
Message-ID: <103656@sun.Eng.Sun.COM>
Source record: 18793

Modifying the Kenwood TM-721A for Extended UHF Coverage

Well I finally uncovered the specifics of the mod which will extend the UHF coverage of the TM-721A. This mod changes the UHF receive from it's factory setting of 438 - 449.995 mhz to approximately 420-460 MHZ. There are some peculiarities surrounding this mod so I'll describe them first.

First of all, this mod will allow the UHF digital display to traverse from 400.000 to 499.995. The radio will not, however, tune this entire range due to a combination of a limited synthesizer lock range and the input RF amplifier bandwidth. The apparent useful tuning range is about 420-460, with sensitivity dropping off sharply at either end. Naturally, the best performance is in the middle (the Ham Band :-).

Similarly, the VHF tuning range is extended in the same manner. After the mod is made, the VHF side will apparently tune from between 100-199 mhz but as stated above, there is little or no response outside of the published range (138-170 mhz), due to the same reasons as stated above.

As a final side effect, note that performing this mod will remove all out-of-band transmit restrictions on the rig, for both VHF and UHF. After the mod is in place, the radio will transmit on any frequency that it can tune to.

DISCLAIMER:

The author of this report wishes to strongly remind those who perform this mod that it is ILLEGAL to transmit on any frequencies outside of the ham bands, EVEN IF YOU ARE OTHERWISE LICENSED TO DO SO. This is because of the radio's lack of FCC type acceptance for these frequencies. So beware! Unauthorized use of this feature could be hazardous to your ticket. MARS/CAP users are probably OK with a permit.

Now for the nuts and bolts.....

MODIFICATION PROCEDURE

1. Turn the radio on and write down all of your memory channel frequency assignments, PL codes and anything else you have in memory - It will all have to be reprogrammed after the mod. After writing down all of your data, turn off the unit and disconnect it from the antenna and power supply.

2. Next, remove the bottom cover on the unit. Note: this radio contains a number of CMOS parts which could be damaged by static

discharge. Take all of the regular precautions to make sure that you and your tools are properly grounded for anti-static work. Note that there is a hole in the rear of the subchassis which supports the controller circuit board in which you can see a small, black, 1/4 watt resistor which is labeled on the board as R57. Using a small pair of sharp cutters, clip the lead on the end of the resistor. It is not necessary to remove the part, just clip one end and bend it slightly out of the way.

3. Next, remove the top cover and then open the front panel assembly into the service position. To do this, remove the four silver screws, one on the top, one on the bottom, and one from each side. Two of the screws are in slotted holes. Loosen the screws in the slotted holes slightly so as to allow the front panel to be pulled out and swung down in a hinge-like fashion. Once open, set the radio on a table with the hinged front panel hanging over the edge of your workbench. Familiarize yourself with the inside of this compartment. The most notable features are a silver, button type lithium battery to the left of center and a large, multi-pin microprocessor chip on the right. DO NOT DISCONNECT ANY OF THE RIBBON CABLES.

4. Locate the lithium battery and to it's left you will notice a row of five programming resistor positions, with the middle position vacant. The arrangement looks something like this:

```
|
| ____ ______
| I I:II (Bat-) |MPU |
| (tery) | |
| ---- ------
|
| I <- R121 (remove for cross-band repeater operation)
-----------------------------------------------
```

VVV front of rig VVV

The (:) above indicates where a jumper is to be placed. Use care in soldering since everything is quite small.

5. Reassemble the unit in the reverse order as described above. When you power the rig up, the display should show 440.000 and 144.000 on the displays. It is now ready for operation. If necessary, perform the microprocessor reset function by holding down the F button while turning on the power. Reprogram the unit with the data you saved in step 1.

Comments:

There is nothing special about operating the rig once the modification is made. All functions operate exactly as before except that the range on each band is extended as described above. You will probably want to program the band scan limiting channels (A and B) on both bands since otherwise your vfo scanning will be too broad and will spend a lot of

time scanning in areas which it cannot receive.

In addition, there also exists a cross-band repeater mod. I do not know if having this is a prerequisite to performing the mod mentioned above. If it is, then R121 will also have to be removed. The cross-band repeater mod has already been discussed on the net so I won't go into it at this time.

Enjoy this mod but don't endanger your license! Don't transmit out of band and don't allow others to, even if they're licensed for those frequencies!

Subject: ft727r CAT interface

FT-727R CAT System Interfacing and Control

This information describes the hardware and software requirements of the CAT (Computer Aided Tranceiver) System in the FT-727R.

Connections

Four connections are used by the CAT SystemL three at the CAT jack, illustrated below, and one (Signal Ground) ar the outer contact of the MIC or EAR jack.

DO NOT SHORT THE OUTER CONTACT OF THE CAT JACK TO GROUND!!!

[Diagram of the CAT plug:

Looks like a stereo audio jack of the appropriate size.

The outer sleeve is +6 to +12 V DC (Battery Voltage) I do not think this line needs to be connected.

The middle contact is the Serial KeyCode Input.

The center contact is the Serial Meter Output (00h to 0Fh).

See the manual for further description.]

Data Format:

All serial data consists of single byte binary codes sent at 4800 baud, TTL levels, with two INVERTED stop bits and one INVERTED start bit.

Key Codes:

CAT Control consists of duplication the keystrokes that can be made on the tranceiver keypad by sending the corresponding keycodes to the Serial Keycode Input contact of the CAT jack. The most significant four bits (MSD) correspond with the key column and the least significant four bits (LSD) correspond with the key row. The Function key (on the side of the tranceiver) is simulated by setting bit 7. Results are identical to those described for manual operation in the FT-727R Operating Manual. Serial Meter Output is sent approximately every 100 ms while receiving.

[Table for the codes. The lines in [] are the original values in the
Yaesu handout, and are followed by the corrected lines as determined

765. Need frequency information for microwave transmitter

Newsgroup: rec.ham-radio
Date: 1989-05-08 21:15:49 UTC
From: miket@brspyr1.BRS.Com
Message-ID: <5847@brspyr1.BRS.Com>
Source record: 18786
Cross-posted to: sci.electronics,rec.ham-radio

I'm seeking microwave transmitters of certain frequencies and need some assistance. I recently purchased a Sears garage door opener transmitter (Model 53708) which I assumed would have the frequencies I need. Unfortunately, it appears to be frequency-adjustable, with no indication of what the possible frequencies are.

The chip used is a TI TX8835 N 96856. It is connected to a 9-dipswitch unit with 3 positions per switch. I'm assuming that this allows certain pins on the chip to be placed high, low, or neutral. As there are thousands of possible combinations, I have no way of finding out what the possible frequencies for this chip may be.

I'd greatly appreciate it if someone could e-mail me some information about this chip; specifically, what frequencies it can produce and how certain pins need to be tied to achieve them. Many moons ago I had access to chip specs manuals that would give me this information, but, alas, no more.

Please e-mail rather than post. Many thanks in advance.

copied from packet radio:
Subject: 220-222 and Motorola

Last night I sent out a short paragraph from Mobile Radio Technology March 1989 issue. It talked about Motorola's not going to build equipment for the "new" 220MHz to 222MHz band because the channel spacing isn't suited for repeaters.

This is to deal with the thinking at Motorola and point out the ideas that they are looking to. Mr. Robert W. Galvin of Motorola says that the 400Mhz of spectrum used for TV broadcasting should be "recovered" for use by industry and government. His idea is to place all TV on a broadband fibre optic cable. The reasoning behind this is that 400MHz of the spectrum is used for point to point communications (TV).

The bottom line is the almighty dollar that the industry sees on the horizion. To quote Mr. Galvin, "...will, at a minimun, double annually the dollar volume" of business transacted in the sale of TV receivers, transmitters and accessory items.

Already the TV spectrum has lost some channels to cellular telephones, 800MHz land mobile, etc. Now the industry has their eye on almost every useable part of the spectrum available. It's time for us to quit all the petty squabbles over code vs no code and utilize the bands we now have because the cow ain't sacred any more!

> BTW, what
>has happened to the GE receivers that did phase correction in the home
>based on the vertical interval test signal (line 22???)?

It is called a VIR (Vertical Interval Reference), and it is sent on line 19 (both fields). As far as I can tell, it is still included with virtually every network TV program.

The idea of a VIR is to insert a standard test signal into the video at the earliest possible point in the production of a program. It then rides through the remainder of the process and presumably undergoes the same distortions as the video itself. The VIR includes references for luminance gain and setup (white and black references) and chroma amplitude and phase (color saturation and hue). By adjusting the signal so that the VIR looks right, so should the video.

But VIR isn't foolproof. It is not that hard for a TV engineer to "strip off" the VIR and insert a new one. All you have to do on most tape machines is to tweak the vertical blanking such that it blanks line 19. The VIR inserters downstream of the VTR (e.g., at the control room output or transmitter input) will then automatically insert one of their own, correct or not. If (big if) properly used throughout the production process, VIRs work reasonably well.

Actually, I think the reason the VIR receivers haven't caught on (other than cost, of course) is that, for the most part, they really aren't needed. Modern NTSC equipment (including home receivers) is far more stable than it used to be. Things like digital time base correctors handle all the little annoying chroma phase mismatches that used to cause hue shifts unless the engineers kept constantly tweaking everything.

The VIR isn't the only test signal in the vertical interval. There are lots of others, most of which are only of interest to the transmitter engineer. There is a "chroma stairstep" for measuring "differential gain and phase" (intermodulation distortion to you audio engineers), various impulses for measuring overshoot and group delay, a line of color bars, and so on. I used to spend hours taking scope photos of these things when I worked in public television.

769. Reply to info request re MFJ 1278

Newsgroup: rec.ham-radio
Date: 1989-05-09 01:43:59 UTC
From: SKOHC@CUNYVM.CUNY.EDU
Message-ID: <8905100704.AA26820@ucbvax.Berkeley.EDU>
Source record: 18790

In reply to the request for information about the MFJ
Model 1278 multi-mode controller here are my experiences:

I bought the 1278 about 4 months ago, on sale or so I
thought. What I got was what I paid for - an old
model with old ROM. Now, of course, MFJ had nothing to
do with this - it was the company I bought it from who is
to blame (if you really want the name I'll send it to you).

So, first I called MFJ and they agreed to send me a new ROM -
COD refundable with the old one (a nice gesture).

But, then one day, after about 2 weeks of proper operastion,
the unit stopped working - all 3 led's remained lit and the
PTT relay (transistor) remained on (keyed). I called MFJ,
amd was told that this was not the first they had heard
of such occurrences and to send it back. I got the unit back
in about 2 weeks and it has worked fine ever since.

I suppose I could have had a harder time with MFJ.
Also, I might have just gotten a bum unit.

While speaking with them they told me that they were coming
out with an all new model shortly after Dayton - it is
supposed to blow the 1278 away. So, I suggest you wait
and see what new units come out. The 1278 seems to be a
quality unit with good support, however, there are certainly
features I wish it had - which I suspect the new line of
controllers will - namely, true dual port (the ability to
crossconnect via the two ports).

Enough said, 73, and I hope this helped.

p.s. To those it may concern, please take this as
intended - anything but a flame. I do believe
that abortion and affirmative action are serious
issues worth reflecting on, however, regardless
of my opinion, they are not slogans to be compaigned
for, or to be advertised like a new car. So, I
respectfully ask that those who wish to profess
a viewpoint on these issues find a Philosophy
or political activism newsgroup and do it there.
thanks.

770. 4766 Khz

I am on the east coast, and I have been hearing a station on 4766 khz since I got my ICOM r71a last Christmas. They sound like a Russian language station, on all night till fade out in the morning, every night.

They're not listed in WRTH, or any of the SWL loggings I've seen posted. Anyone with an idea who they are, would you please email it to me?

^^^^^^^

In Georgia, the law only prohibits the obstruction of hearing. It does not specifically name any particular device. The police will, however, pull you automatically for stereo headphones. Some have pulled hams for single earpiece sets. As I can attest from personal experience, this does not stand up in court. Most police departments in the metro Atlanta area have been educated to Amateur operations. Ham headset busts seem to be isolated cases of cops looking for something to harass a ham with when he has nothing else to charge.

One thing I'd suggest to any emergency group that works with local police in emergency services - Be sure and always wear headsets when working around the cops. This gets them used to the devices and associates the headset with public good. It'll take quite some time for it to sink in on some of the single digit IQ types but it's worth the effort.

SUBJECT: Going to higher frequencies - why not roll-your-own?

The recent discussion on the net regarding equipment for higher frequencies leaves me a bit confused. The discussion seems to have been largely along the lines of 'how do we get the Japanese to build us all-singing all-dancing black bricks so we can pay vast numbers of dollars for them'.
My question is WHATS HAPPENED TO THE 'AMATEUR' ??

Why, oh why does everyone cough up their lifes savings for poorly engineered, gimmick-laden Oriental gear, much of which has more 'microprocessor' than 'Radio' in it? (the recently discussed image problems of certain rigs is a perfect example of the grotty RF engineering i speak of!!).
Surely theres SOME of you out there who have access to Motorola/TRW applications notes for microwave devices, and can etch a double-sided PCB in the bottom of a discarded yogurt carton!
Add a crystal, a handfull of discrete devices (or ICs if you must - the Plessey SL6270 VOGAD chip is a good starting place) for audio, and you can for the cost of a set of nicads and a few evenings work, build yourself a 1.2GHz single-channel FM transmitter with an output of a couple of watts.
Stick this into a simple beam (made of offcuts of copper tube - NBS did all the groundwork YEARS ago!) and you are on the air!
Sure, its not synthesized, it only has one channel, and theres not a microprocessor or memory anywhere to be seen, but remember it only cost you fifty dollars!

Why, oh why does everyone go begging, Amex card in hand, to the Orient for equipment of dubious quality and hopeless RF engineering? Surely some radio club could do the basic design work (borrow a spectrum analyser!) and sell the boards at cost-price just to get things started.
(i remember the trials of getting onto 430 megs many years ago when the 2N3866 was a *NEW* device and everyone still used AM!)

This is a Cuban relay of the Soviet Mayak Program. The frequency is usually
listed as 4765kHz variable. It has been on the air for several years now and
is regularly heard in N. America. This may explain the relatively few number of
loggings in SWL publications, except maybe in Pop. Comm. I think that it
appears as 4765kHz v. in recent editions of the WRTH.

Opinions are like a**holes. Everybody has one.

From: STELLABO@CSHLAB.BITNET
Message-ID: <8905100705.AA26946@ucbvax.Berkeley.EDU>
Source record: 18796

Can anyone help?
After my last CW contact that was very difficult due to QRM, I feel it is time to get a CW filter. As a new ham I am not sure which one to buy. There is a 500hz and a 270z filter from Kenwood. Which one is better ? Is there any other manufacturer that makes a better/cheaper CW filter for the TS440 ? Should I consider using some audio filter instead of the rf filters ?

Thanks in advance. Please mail mail replys to: STELLABO@CSHLAB.BITNET or just post them to the bulletin board.

I approached the manager at the booth that was "displaying" the wx stations among other "fleshly" things.... I asked him what he was selling, flesh or wx stations and told him I thought it was pretty crude to use such tactics.

I'll be the first to admit that the working models there would turn heads of any normal male. I just don't think that such methods are appropriate in a forum like that. If some private club or group wants to get off on that kind of stuff, then so be it. But there were a lot of people who weren't so impressed, including a lot of women, children and myself.

Good for you! Reminds me of a newspaper trade show years ago, where a model dressed in a bathing suit and T-shirt would jump into a pool to demonstrate that such-and-such printing plates could be cleaned with water instead of expensive solvents. On the last day of the show, she "helped" the president of the firm do the demo - in his 3-piece suit.

Is this joint called Digitar, or something similar? If so, stay away from these buggers! They are battery hogs, cheaply constructed (the wind direction pots are not weather-sealed very well, and will develop noise after a few weeks outside, etc.), have a miserable user interface (but then, no worse than most rice-boxes), and get so screwed up in the presence of even a little RF that you have to remove all power for tens of seconds and then re-enter all the calibration data!

>
Once modified this way, the rig will do some strange things when scanning
the entire 'band' when you have an 'even' upper band limit, such as 148.000.
The rig will scan up to that position, and then fluctuate between the upper
and lower band limits. Reversing the scan direction (with the main tuning
knob or the mic up/down buttons) will re-start the scan in the proper
steps. I'm not sure if it's this mod that does it, but I sure didn't
notice it before.

The cross band repeater mod DOES have to be done first. We tried it on a
rig fresh out of the box, and untill the cross band repester mod was done,
this jumper dosen't work.

Anyone heard anything about the Kenwood dual-band HT?? It supposedly uses
the same CPU as the 721. Hand held cross band repeater, anyone?

>combinations, I have no way of finding out what the possible frequencies for
>this chip may be.

This is admittedly just a guess, but is based on knowledge of my own garage-door transmitter. The dipswitches probably don't alter the frequency at all, but control some sort of code modulated onto the carrier. This is supposed to provide greater security and prevent a would-be-thief from simply driving up to your house and blasting selected frequencies at your garage until the door opens, or simply carrying a number of common door-opener transmitters and trying them until one works (don't laugh, it happens). The number of possible codes in my case is 2^10 (1024), since there are 10 dipswitches.

The frequency is most likely determined by a crystal oscillator. There's probably a tuning coil with a powdered-iron slug for tweaking it, although not all designs have this. Some only have fixed inductors and a small trimmer capacitor for matching with the printed circuit loop "antenna".

Longish .signature follows. Skip now, or don't complain.

There was a very complete writeup in QST a few years back (1984?) which went into the entire CTV RFI/leakage problem complete with freq. charts etc.

ARRL or your local library should have a copy, or send me and SASE and I will Xerox one for you.

HELP !

I have a problem with my REALISTIC PRO-2004.

I'm receiving a very noisy weak station (S 0 to S 1).
If I change the frequency to 5 kHz below the nominal freq of the
weak station then I will have almost noise free receiving !

This seems to be the same to almost every weak stations I'm trying to
receive so I don't think that all the transmitting stations is off the
frequency.

I have checked the master 10 MHz oscillator in the scanner
and it's less than +/- 10 Hz wrong (zero-beat against national freq-reference).

Does anyone has any idea what wrong or some ideas about further
faultracing in my PRO-2004

Sincerly,

Lars Nilsson (Member of Radio Communications Assc. SWED-003)

Hello All,

I sent out a message the other day telling people how to get the latest
bits (KA9Q release 890421.0) from my BBS, and mentioned that anyone
interested could use anonymous UUCP to access the files. What I forgot
was to tell everybody how to find the information on the files you desire
to retrieve. Well here one more time is the listing, and hopefully with
enough information to allow anybody access that desires the information...

+--+
HOW TO ACCESS THE WB3FFV AMATEUR RADIO TELEPHONE BBS !!!

I have placed a BBS system on-line that is mainly oriented towards the
Amateur Community (but there is other stuff on-line). As of now I have not
attempted to promote this system any place except in the amateur channels
(PACKET, USENET, & word of mouth), and will continue under this policy, as
I hope to keep it oriented toward amateur radio. The various software for
UP/DOWNload is available via telephone dialup and Packet TCP/IP, and through
user support I hope to keep the latest and greatest ham software on-line.
Below is the information that is needed in order to access the BBS via
Telephone -or- TCP/IP, please pass it around to as many ham's as possible.

System Name: WB3FFV
Login: bbs
Number: (301)-335-0858 -- 1200 & 2400 (Non-MNP)
Number: (301)-335-1955 -- 2400 (MNP), 9600 & 19200 (PEP)
Data Settings: 8 Bits, NO Parity, 1 Stop Bit
Times: 24hrs/365days (except for routine maintenance)
Software: XBBS (UNIX/Xenix Multiuser BBS)
IP Address: 44.60.0.1 {wb3ffv.ampr.org} [for FTP access on 145.550 mhz ONLY]
Misc. Info: Machine is an 80386 computer running UNIX V.3.2 and features 300+
meg of on-line storage. Most transfer protocols are available!!

I attempt to keep the latest and greatest HAM software on-line, and encourage
all to upload anything new that they come up with, as it is of benefit to all.
Here is a sample of a couple pieces of software that is available for DOWNLOAD:

KA9Q TCP/IP Software for the PC (Latest OFFICIAL release + TEST Versions)
KA9Q TCP/IP for the Atari-ST, MAC, & Amiga
KA9Q TCP/IP for UNIX based systems
WA7MBL BBS for the PC (Versions 3.31, 4.31 & 5.12)
W0RLI BBS for the PC (Versions 6.xx, 7.xx, 8.xx, 9.xx)
Various BBS utilities and enhancements
Several MORSE CODE Tutors
TheNet software by NORD><LINK (Version 1.01)

Modifications for many HAM Rigs and Scanners
Digital Signal Processing software (DSP)
DX and contesting programs
ARRL Newsletters & Gateway
W5YI Electronic Edition

There is much more available on the BBS, and I don't want to waste a lot of PACKET BBS space trying to list it all, so if you are interested give it a call and see for yourself !!!

For anybody that desires to use UUCP for file transfer, use a login of uucpanon and no password! Also to obtain a listing of the files that are avalible for UUCP transfer, request a file called FILES in the directory /usr/spool/uucppublic.

P.S. - This system will be kept current within several days when it comes to the TCP/IP software, as I am trying my best to promote IP in the PACKET community...

788. sci.commtech Call for Discussion

Newsgroup: rec.ham-radio
Date: 1989-05-09 23:15:49 UTC
From: klopfens@bgsuvax.UUCP
Message-ID: <4102@bgsuvax.UUCP>
Source record: 18808
Cross-posted to: comp.ivideodisc,comp.graphics,comp.sys.ibm.pc,rec.ham-radio

I would like to get reaction to the formation of a newsgroup, sci.commtech, for the discussion of new communication technologies and their impacts on users (both end users and organizations), media industries, media audiences, and society. The group could be used to post information on developments in new media technologies (generally all means of text, audio, and video generation, storage and transmission). As digital technologies continue to transform the broadcast and electronic media, those of us who grew up in the media/communications field have much to learn from those of you in the computer field.

Example new communication technologies include

* new video technologies (HDTV, IDTV, interactive video, videodisc, picture-in-picture)
* new tape storage technologies (S-VHS, digital VCRs, digital audio tape)
* new optical disk technology applications (compact disk technologies (CD-ROM, CD-Video, CD+Graphics, erasable CDs)
* new delivery technologies (direct broadcast satellites, digital video-on-demand, pay-per-view)
* new telecommunication technologies (integrated services digital network [ISDN], fiber optics)
* new computer-based communications technologies (electronic text [including electronic newspapers], electronic mail, computer networks, videotex [e.g., Prodigy], teletext)

Discussions about *both* new technical and application developments, as well as policy issues related to these new communication technologies would be appropriate. A current policy topic, for example, would be telephone company involvement in cable television.

Please *post* any comments on the name of this newsgroup, its charter, whether or not it should be moderated and, if so, who the moderator should be. Looking forward to your reactions.

789. Re: Need frequency information for microwave transmitter

Newsgroup: rec.ham-radio
Date: 1989-05-10 00:32:19 UTC
From: wiz@xroads.UUCP
Message-ID: <690@xroads.UUCP>
Source record: 18810
Cross-posted to: sci.electronics,rec.ham-radio

Regarding the garage door opener question:

I highly doubt that the dip switches CHANGE the FREQUENCY.
They, as with 99.9% of the rest of automation products, change the pulse count or CODE sent to the receiver. The receiver is SET at a FCC approved frequency. Normally a company receives 1, maybe 2 frequencies to run their production on with garage door openers.
It is then up to engineering to develope a smei-fool proof (hah hah ;-) way of discerning the owner from the guys next door.
If you change the dip switches, you are changing the code sent via the oscillator to the receiver. You must then change the code at the receiver to match what your transmitter is set for.

If they indeed DID change frequency, 9 dip switches would enable you to go almost anywhere within the spectrum.
Like I said...I doubt it.

The FCC wouldnt approve.

Enjoy!

790. Re: TV flicker at 50 Hz

Newsgroup: rec.ham-radio
Date: 1989-05-10 01:00:53 UTC
From: marc@mas1.UUCP
Message-ID: <1862@mas1.UUCP>
Source record: 18811

Having spent my teenage years living in Paris (as F0BMZ) I can attest
to the fact that French TV flickers more than American TV, but is not
very annoying.

The color is noticeably better than NTSC -- there is no contest.

The French don't watch TV as much as we do. TV starts at noon and ends
around midnight. There are only three government-contolled channels,
and the programming is the PITS. All TV's are registered with the government
and you have to pay a yearly tax to own one (plus, you have to watch
commercials :-) so many people just don't bother.

Also, alcohol affects one's ability to detect flicker. The French really
DO consume alcohol with just about every meal. I just wouldn't want to
push this point too hard... :-)

> byer@unisoft.com
It seems to me that if the cable has a leak and is letting its signals spew out into the air, then it is only reasonable to assume that signals floating around in the air can get sucked into the cable via the same leak.

As I recall, in our area, when cellular phones where first introduced, the cable company changed the channel of some of the pay channels so that if a leak appear in the cable, the pay cutomers would not have their extra cost channels wiped out by phone calls.

793. PAL Flicker

Newsgroup: rec.ham-radio
Date: 1989-05-10 01:37:56 UTC
From: julian@bongo.UUCP
Message-ID: <198@bongo.UUCP>
Source record: 18814

I did say in an earlier posting that I considered that all the flickering PAL complaints I heard were from US technicians that only saw PAL on monitors in rooms with 60 Hz lighting. I stated that my assumption was that the "flicker" was the "beat" between 60 and 50 Hz. Phil Karn wrote saying that PAL TVs flicker in their native land (Germany). He said the flicker was so bad he was glad he was not an epileptic.

Well today I was in a teleport facility, or whatever these places that feed TV signals into satellites are called. On the wall was a monitor with a test pattern on it. It also had a most disturbing flicker, Phil may be glad he is not an epilectic when seeing monitors in Germany, I am glad I was not non LSD seeing a PAL monitor under US 60 Hz lights. A technician came up to me and I asked if that was a PAL monitor. He said that some monitors were worse than others. Yes it had a very discernable flicker rate, but the picture quality was nice.

Just say "Yes" to No-Code Buttons still available.

Yours

Three cheers for Glenn Elmore and his digital microwave work! The stuff he's developing is indeed exactly what we need for the future of amateur radio - as a technical challenge, as a way to use our microwave allocations, and as a real utility that we can apply to public service communications.

At the speeds Glenn is working (roughly 1-10 megabits/sec), packet voice is an entirely practical application. Not just one conversation at a time, either, but literally dozens, all dynamically sharing a common transmission facility. (Packet voice does work, by the way. I've had an experimental Ethernet telephone on my office desk for several years now.)

Consider that mucho bucks have been spent by some of the larger repeater networks to handle just ONE SINGLE QSO at a time. Now consider that a network of Glenn's microwave links interconnected by packet switches could handle a continuous mixture of voice, data (text, programs, etc) and fax-type images from many different users at the same time. There ought to be plenty of interest in such a network from the repeater clubs and operators! They generally have the bucks, the tower sites and the people contacts to make something like this work. All we have to do is to sell them on the idea, and our data can ride along for free...

The big problem, as Glenn alluded to, is in getting everyone to contribute towards a shared facility. Hams are, by nature, rugged individualists who take pride in their own personal achievements. As an AMSAT volunteer, I have encountered many people who won't think twice before buying (or building) an expensive HF linear they don't really need, but can't be convinced that contributing much less money towards a (shared) satellite would, in the end, enhance their ability to communicate much more than the linear. The most they "get" from the satellite is a picture in a magazine; they can't touch it or show it off to their friends, and (they reason) it'll be there anyway even if they don't contribute. Problem is, if enough people think this way, the project will never happen.

I see AMSAT Phase IV as the perfect complement to Glenn's terrestrial microwave work. Microwave links will start on the densely populated coasts, with satellites providing the long-haul connectivity. Unfortunately, neither will happen without a major evolution in the way amateurs think about their service.

Phil

796. What kind of PSK is used on FO-12? MicroSats?

Newsgroup: rec.ham-radio
Date: 1989-05-10 04:14:43 UTC

Could someone please tell me what kind of PSK modulation is used on FO-12 mode JD. What about the "MicroSats"? I understand G3RUH has a PSK modem kit that works with FO-12 on mode JD, and "RadioKit" sells a PSK modem kit for satellite use.

...But what do these modems consist of?? Are they similar to BELL 212?? Do they run BPSK? QPSK? What baud rates are involved??

HELP! (Please!)

Source record: 18821

Well, I just got my ticket yesterday. I bought a radio and a TNC at Dayton. I just put the 2.82 EPROM in, after cutting and jumpering. The non-volatile chip I have now is a Xicor X2444 Serial NOVRAM. What is the part I need to replace it with, and where can I get one? While reading the "Reference Guide to XICOR Nonvolatile Memories", I found the X2444. It is a 16 x 16 bit part, max clock is 1MHz, max store cycles is 100,000. I see the part number X2443 in the manuals I have, but not in the guide.

Please e-mail.

Thanks,
John

Subject: 50-Hz vs 60-Hz

Date: 10 May 1989 (16:59)

I've been watching the discussions on 50/60Hz for a while and since I live in a country that runs at 50-Hz, I have some subjective observations that may be useful.

First off, some facts about our TV setup as I imagine some are unfamiliar with our local scene.

o The Australian public broadcasters only use PAL.

o It's all at 50-Hz.

o Originally transmitted on VHF, however, over the last 4-5 years our FCC equivalent has been encouraging the broadcasters to move to UHF.

(My suspicion is that this is simply because the rest of the world is going this way and we are too small a market to do anything but follow...

o A lot of our shows come from the US/UK and presumably go through substantial translation to be transmitted as PAL.

Yes, we do get all the major serials: Dallas/Dynasty/Kelloggs <sigh>

No, I've no idea whether ours are ahead or behind in story line (sometimes they use us as a test-ground due to our similarity in TV-cultures).

Now for the subjective bits.

I have never, ever noticed any 50Hz beat/flicker. Further I have never, ever heard anyone mention or complain about it in this country.

Sorry about the "never, ever"s but it's really the case. I'm certain that if it was a common complaint then it'd change - too much money in advertisement to be ignored!

Now we have as many TV addicts per capita as the US, so the only conclusion I can come to is that it is something you subconciously learn to ignore/notice.

But it must take some effort, I along with a number of my work-mates were in the US for about 4 months watching 60-HZ computer screens day and night and no-one noticed anything either on arrival in the US or on our return to 50-Hz-land...

So, presuming we all come from the same gene-pool, I have to suspect that those people who do notice it are highly attentuated and, perhaps this needs to be combined with a life-time of 60-Hz before you become aware of it...

Disclaimer: Disclaimer's aren't worth the paper they're written on.

799. Fox Hunting

Newsgroup: rec.ham-radio
Date: 1989-05-10 12:49:00 UTC
From: SAC.2001CS-XP@E.ISI.EDU
Message-ID: <[E.ISI.EDU]10-May-89.07:49:13.SAC.2001CS-XP>
Source record: 18823

I know this may be a little late, but some things I have seen
done on fox hunts:

Put radio and batteries in a plastic box with a hook on one end
and a *dipole* antenna at the other end. Tie to a long rope.
Hang this from a bridge, preferably a high one. Twist rope so it
winds and unwinds. Weights added to the box may help. This
provides a nice fluctuating pattern.

Use a tuner and load up several miles of railroad track. Use
old, little used or abandoned track. BTW, this also works good
for 160m if you have any abandoned track nearby. Good DX!

Use caution here. Put a beam on a lower bracket of a high tension
powerline tower. Aim the beam down the power lines. It will
look like every tower is an antenna location.

I have seen several dipoles built for HTs that just hook onto the
BNC connector, go up about six inches and out. Made of coat
hanger wire usually. Looks like old surplus survival radios.
Get any old slow motor you can find, gear down to about 1-3 rpm
turntable and fix the HT to that. Put this under a bush, atop a
building, especially anywhere not readily visible and subject to
multi-path. A true challenge.

Avoid vertically polarized antennas. Use horizontal, circular, or
multiple antennas. Use directional antennas and point them at
passive reflectors.

These ideas should only be used with experienced fox hunters as
they may be too frustrating for new comers. I have seen all of
these ideas used in fox hunts over the years.

Have fun and 73,

Then I must have an even sillier question: how do I get the programs to translate that three-line notation into something useful for a dumb want-to-be looker ("Hey look, Ma! That there spot is a satellite!")?

AMSAT provides a software exchange or programs for satellite tracking. (you exchange your money for their software, actually the money goes to a good cause and I think is considered a donation) Some are quite good, with maps and graphics and such. I use quiktrak and found it very useful.

AMSAT's number in D.C. is (301) 589-6062.

806. PRO-2004 losing memory

Newsgroup: rec.ham-radio
Date: 1989-05-10 15:26:29 UTC
From: jimkirk@OUTLAW.UWYO.EDU
Message-ID: <890510092629.20201707@UWYO.BITNET>
Source record: 18580

My recently-purchased PRO-2004 is losing it's memory overnight. I have replaced the battery, to no avail. With the battery disconnected the unit properly blinks and beeps it's warning, so it's not just a busted battery connector. Is this a known, simple-to-fix problem? I'd like to avoid shipping it off for repair (just because it would take a while; I have not modified it (yet)).

807. Airshow Information

Newsgroup: rec.ham-radio
Date: 1989-05-10 15:39:00 UTC
From: ppddc@uwocc1.uwo.ca
Message-ID: <0610804533@uwovax.uwo.ca>
Source record: 18581

The London (Ontario) International Airshow is scheduled for June 3 and 4
this year.

It is an excellent show and well worth seeing. London is located halfway
between Detroit and Toronto on the 401 highway. Many planes from the U.S.
and overseas fly in for the event--mainly military aircraft though.

Our local repeater group is putting together a special events station
and we hope to be on two meters, packet and HF. The organizers had
rejected our original request because they felt ham radio had nothing to
do with airshows and that they needed no help with communications. They
also said the show would not gain anything (financially) by having us there.

We have since been lucky enough to be able to work with the Royal Canadian
Airforce Association to secure a small site on the grounds.

I will post more information as it becomes available but we would appreciate
making as many contacts as possible and seeing as many people attend to
make this special events station as successful as possible. Maybe the
organizers will have a different view of ham radio by next year.

Anyone who has information on how to publicize this information to the
pilots that are flying in (i.e MARS) please email me direct. We hope
to have a CFARS (Canadian Forces Affiliated Radio Service) operator available
and he should be able to work the same bands as MARS.

Also, we hope to scan the bands with a couple PRO-2004s so we would appreciate
any tips on frequencies. If we find anything unusual, I will be sure to
post it.

>
> ...
>
>73, Bob, W3OTC
>----------
What am I missing here? What does the video delay line (presumably the one in the Y channel) have to do with (color) phase correction? I always thought it was to equalize the time delay through the Y (wideband, and short delay) channel so it matched the delay through the chrominance amplifiers (which are narrower band and longer delay). What do you see as the cause of "loss of" vertical resolution?? Seems to me that's determined by the number of lines per frame, and has very little to do with delay lines and phase corrections. Now _horizontal_ resolution (as perceived by the viewer) is determined by video bandwidth (and horizontal scan rate), and _can_ be affected by mismatch of delays, but is also affected by things like color dot (or line) pitch and convergence. I would think mismatch of delays would be the least of the worries: it should be fairly easy to get "right". And risetime of the delay line also shouldn't be a problem: you can do as good as you need to ("real" TV's, I'm sure, are designed to a target price...). BTW, some NTSC receivers were designed with two delay lines: one in the Y channel and another in the I color channel; the Q color channel was the narrowest band of the three and had the longest delay. The other two were delayed to match it. I'm only aware of that being done in 1954 (!) and earlier receivers (though it probably was held over for a while after that).

> properly equipped amateur stations, although two satellites (OSCARS 9 and 11,
> built by the University of Surrey) are planetary science experiments.
>
> We build the world's cheapest satellites.

The May 1989 issue of QST (an amateur radio magazine you can find in many libraries) carries a detailed article "Microsat: The Next Generation of OSCAR Satellites", part 1 of 2, p.37-40. AMSAT-NA plans to launch 4 Microsats into sun-synchronous polar orbits, piggybacking on a single launch vehicle this year. Microsats are 10 Kg cubes, about 230 mm on a side. I recall hearing at a seminar that they cost only about $40K each. They said the satellites are stabilized using permanent magnets and spun by photon pressure on one side of the antenna masts. Simple!

The primary goal is to implement a digital store-and-forward message handling packet-radio satellite system available worldwide. It is also a demonstration of what how small spacecraft can get using modern microelectronics. The computer has a NEC V40 (8088 clone) with 8MB of RAM disk. The structure has been flight qualified for any of the world's currently available launchers. One of the Microsats will carry a speech synthesizer, which will broadcast telemetry and messages receivable by school children using common scanners. The article goes into detail on the conception, and on the power, radio and computer systems. Next month's article will carry operational details.

>is a 500hz and a 270z filter from Kenwood. Which one is better ? Is there
>any other manufacturer that makes a better/cheaper CW filter for the TS440 ?
>Should I consider using some audio filter instead of the rf filters ?

A common dilemma, and the answer (as usual) "depends on what you are doing".
For casual CW around the US, I would suggest the 500Hz filter (BTW try the
Fox/Tango Club - they carry a lot of GOOD Kenwood filters). Personally if I
only had ONE filter, the 500Hz would be my choice the 270hz is just too hard
to tune - you have to be SLOOOOOW. If you are "into" contesting or DX then
the 270Hz is worthwhile, but you will probably want both!

Audio filters are great for some extra "cutting", but are no substitute for a
GOOD "knothole" in the IF, otherwise you end up getting the IF/detector
overloaded and/or the AVC "pumping" from a strong signal. I have an audio low
pass filter which I use unless I use the 80hz audio filter. The 80hz filter
is mostly useful on 80M to cut QRN, but quiets a pileup on weak ones if you
use it with the 270Hz IF filter.

Tuning with the "narrow-narrow" option is a real chore, but interesting to
listen to. QRM is almost non-existant, signals just pop into existance and
then disappear. You need to be careful when looking for a clear spot though,
people get upset if you are <100Hz from them, but with all that filtering
it is hard to hear someone that far away!

The other thing that you need to watch for is overloading anywhere in the
receiver. Most modern receivers are not bad in that area, but the 75A4 is
still the undisputed king in my books. Oh why did I ever trade mine!
(They STOPPED production in the 1950's and were in a box that 2 ft cubed
which had something to do with it).

If ANY part of the receiver gets driven into overload then no filtering will
remove the trash. About the only way to find out if you are getting an
overload problem is to switch in a 20db pad and see if the QRM goes away, if
it IS then you are overloading something.

Well thats a long response to a short question, but I hope the info is
useful. Try a low pass audio filter anyway, and don't forget a GOOD speaker
with NO "tweeter". Many 'rice box" speakers are just trash and add as much
noise as they develop in audio. Also try some GOOD stereo headphones, the
type that "cup" over your ears, this helps with the noise in the shackk which
can often mask the really weak ones.

Message-ID: <8905101852.AA28113@cmr.icst.nbs.gov>
Source record: 18585

Marc (KG6KF) talks about TV in France some years ago. One of the items has certainly changed; the number of channels/networks. The original three channels (TF1, A2, FR3), they have Canal Plus (partly pay), "le Cinq" (channel 5), and a sixth network either on the air or about to be. With all these networks, the demand for something to air will certainly dilute the "national content" rules that they, and many other countries, have.

In addition, they, like the Brits, are moving to "privatization". It seems to me that Antenna 2 (A2) has gone private ownership, and the three new networks were never government owned.

Actually I thought this stood for Keep It Simple Stupid (as in KISS
principle :-), at any rate the KISS protocol IS an elegantly simple solution to
the handshaking between the TNC and the computer. That is making sure that
each only sends when the other is ready to receive - a problem with some VERY
subtle aspects to it.

'Sounds like your squelch is slow at stopping the scanning function.

Most scanners that I have played with use the squelch break to stop
the receiver from scanning.

You might try the obvious first before you tear into the thing. Try
decreasing the squelch threshold setting on the receiver.

It was I believe Voltaire who said: "I disagree violently with what you say, but will defend to the death your right to say it."

There are many things I read which run counter to my beliefs and mores, every time I read or hear something I disagree with, I consider the above. Each of us no-doubt has a belief and we have the right to state it. If we went around as a bunch of whining ninnies afraid to offend the pretended sensibilties of other ninnies and poltroons, not much would get said and even less would get done.

Out there is the real world, most of the inhabitants have customs that are counter to your standards of behaviour, it shows breeding and maturity to allow others their customs and beliefs. Do we really have to clothe the noble savage?

Have we forgotten the Salman Rushdie affair already?

Yours

Maybe a misspelling of BAUDOT? The code used by older Teletype gear,
commonly used by hams, consisting of 5 pulses per character (plus the
start and stop pulses). Named for Emile Baudot, whose code was actually
different; the code we call Baudot is more properly called Murray, but
nobody calls it that. Officially it's International Telegraph Alphabet
#2, ITA #1 being the original Baudot. 60 words-per-minute Teletype
uses Baudot. It's also used at 100 WPM, but then ASCII is also used at 100
WPM. See also BAUD - the speed of signaling in units per second,
where a unit is a bit with conventional FSK transmission, but might in
general be more than a bit. (e.g. four-level phase shift keying transmits
two bits per unit element).

820. French TV channels

Newsgroup: rec.ham-radio
Date: 1989-05-11 06:36:00 UTC
From: HUTIN@eps.slb.COM
Message-ID: <8905110705.AA10744@ucbvax.Berkeley.EDU>
Source record: 18594

There are 6 TV channels in France:

-TF1 general purpose commercial channel
-A2 general purpose public channel
-FR3 general purpose and regional information public channel
-CANAL PLUS movies and sports commercial channel (scrambled)
-La CINQ (the five) general purpose commercial channel
-M6 general purpose commercial channel

These six channels are available in VHF or UHF in all the country.

There is no local TV in France (except a few exception).
Local news are provided on FR3 channel during half an hour per day.

There is a very low number of satellite receiving stations (less than 5000).
There is also a very low number of cable plugs (less than 100000).

73s from FE6CNB Remi from Paris,FRANCE

PS: The number of home in france is around 20 000 000.

N8IWJ To Publish Monthly PROJECT DOVE PRE-LAUNCH NEWSLETTER

Rich Ensign, AMSAT-NA Science Education Advisor, wants to remind amateurs that the BRAMSAT MICROSAT known as DOVE (Digital Orbiting Voice Encoder), is a unique tool to be used by educators in classrooms all over the world. It's globe-circling nature will enable it, once launched, to be used in many areas of the curriculum. DOVE's first activity, dubbed Language Arts Project 1, has students creating messages of peace in many languages to share with each other around the world. DOVE's speech transmissions with a power of up to 4 watts on a frequency of 145.970 MHz should be easily picked up on the ground by basic receivers and scanners. If you are an educator or a radio amateur who is interested in getting a school in your area involved with PROJECT DOVE, there is now available a monthly "PROJECT DOVE PRE-LAUNCH NEWSLETTER" free for the asking. Rich reports that close to 200 educators are currently receiving this publication. The newsletter is written with the "layman" in mind. It will allow educators who are not radio amateurs or even space science buffs to stay up-to-date with PROJECT DOVE as the satellite progresses toward launch. Rich is also working on a comprehensive teacher's guide to DOVE for release at launch time. Why not help a school in your area become involved with this exciting experiment in orbit. To get your target school and teacher on the newsletter mailing list write:

SB ALL @ AMSAT $ANS-112.01
QT 4.0 TO BE RELEASED AT DAYTON

HR AMSAT NEWS SERVICE BULLETIN 112.01 FROM AMSAT HQ
SILVER SPRING, MD APRIL 22, 1989
TO ALL RADIO AMATEURS BT

QUIKTRAK 4.0 Will Be Ready For Release For The Dayton Hamvention

AMSAT-NA is pleased to announce that QUIKTRAK version 4.0 (QT 4.0) will be ready for release on April 28, 1989. Those who will be attending the Dayton Hamvention will be able to obtain the first available copies of QT 4.0 at the AMSAT booth during the three days of the Dayton Hamvention. After Dayton it will be available from AMSAT-NA Headquarters. This "new" version of Bob McGwier's (N4HY) "premier" satellite tracking program not only retains many of the fine features of QT 3.2 but also allows the user more "flexibility" with the addition of several new features. For example, the number of satellites in which Keplerian data can be maintained has be increased to 100, up from the fourteen which QT 3.2 allowed; also, QTH data can now be kept for over 100 different cities. For those who have auto-tracking capability incorporated into their OSCAR station, with the up-graded "auto-track-ing" capability added to QT 4.0, you can now designate up to fourteen different satellites to be "tracked" by your "auto-tracker" in the order of their appearance at your QTH. For OSCAR users who "hate to enter data," a new "full-screen editor" has been added to ease the "data entry" process. If you enjoy watching the position of the satellites being displayed on maps, QT 4.0 now supports EGA graphics; it continues to support CGA graphics with the user choosing between the two graphics modes by a simple entry in your QTH data file. And for those who enjoy making "visual" contacts with space objects, N4HY has not forgotten you! Bob has added a new feature which will inform you whether it will be possible to visually observe a satellite from your QTH for a given time-of-day and sunlight condition. And finally, the feature in which Bob McGwier is particulary pleased with is the "mutual visibility window" option. Have you ever wanted to set up schedule with another station on an OSCAR satellite but didn't want to have to run your tracking program for both QTHs? With this added "mutual visibility" option you will get a tabular listing of AOS, LOS, MA count, and duration for all "windows of mutual visibility" between your QTH and any of the cities you have entered in your QTH database. Also, for AO-13 users, QT 4.0 will give you the time of "minimum-squint-angle" between you and a selected city. For other satellites, for example, RS 10/11, this feature will give you the "time-of-minimum range" between your QTH and the city you select. So if you are looking for that "rare DX station," this new option in QT 4.0 will definitely take the guess work out of the problem. AMSAT-NA has adopted a new policy on up-grades to QT 4.0 for those individuals who hold valid copies of older versions of the QUIKTRAK program. If you would like

more information about this new "update" policy, please call Martha at AMSAT-NA HQ's at (301) 589-6062. [For owners of QUIKTRAK of 3.2 and earlier versions who will be attending the Dayton Hamvention, you will be able to "upgrade" instantaneously to QT 4.0 at the AMSAT booth. Just bring your original disk to the AMSAT-NA booth and it can be done on the spot.]

SHORT BURSTS

HR AMSAT NEWS SERVICE BULLETIN 112.03 FROM AMSAT HQ
SILVER SPRING, MD APRIL 22, 1989
TO ALL RADIO AMATEURS BT

Short Bursts

AMSAT-NA's VP of Field Operations, Jack Crabtree, (AA0P) would like to announce the following appointments of new AMSAT Area Coordinators:

Vinnie Banville, WB2YGA, Waymart, PA
Dick Campbell, N3FKV, Annapolis, MD
Roy Robinson, K4EDU, Augusta, GA
Dick Schiller, K4BQH, Crestwood, KY

Each of these appointees has been highly recommended by their respective AMSAT-NA Regional Coordinator. AMSAT-NA extends a hearty welcome to each of these new Area Coodinators to the Field Operations Team.

For those OSCAR satellite enthusiasts who subscribe to QST, in the May issue please take special note of the front cover. There you will find an artist conception of what the AMSAT-NA Phase IV geostationary satellite will look like as part of the ARRL's 75 Diamond Jubilee QSL card. Also, on page 37 of this May issue of QST, you will find the first of a two-part series on the MICROSATs. This article by Doug Lougmiller (KO5I) and Bob McGwier (N4HY) is only part of the MICROSAT "media blitz" which will be going on for several months to come.

TO ALL RADIO AMATEURS BT

Mir Cosmonauts Are Scheduled To Return To Earth On April 27, 1989

According to Ron Broadbent, G3AAJ, European Mir "watchers" have been monitoring the increasing voice "traffic" between the Cosmonauts aboard Mir Space Station and ground-stations in the Soviet Union on a frequency of 121.750 MHz. From all indications, the Cosmonauts aboard Mir are planning to return to earth on April 27th at approximently 02:30 UTC. One of the last tasks to be performed by the crew of Mir is to boost the Space Station into a "parking" orbit which will put Mir at an altitude of 500 km. Because of the change in the orbit, predictions based on NASA Element Set #795 [Epoch 89 108.17258843] will be "late" by about 3 minutes/day starting from April 20th. Thus by April 25th, Mir will be showing up 15 minutes later that your tracking program predicts. It has also been reported by "Aviation Week & Space Technology" [the April 17th issue] that because of a problem in the Electrical Power Subsystem, there will be no follow-up crew aboard Mir for several months; Mir will be empty until a repair team can return to fix the problem. So on Thursday April 27th, Cosmonauts Alexander Volkov, Serge Krikalev, and Valeriy Polyakov will cease their amateur radio operations from Mir. U4MIR and U5MIR will go QRT.

AO-13 "DX-PEDITION" TO UA4P

HR AMSAT NEWS SERVICE BULLETIN 118.01 FROM AMSAT HQ
SILVER SPRING, MD APRIL 28, 1989
TO ALL RADIO AMATEURS BT

AO-13 "DX-Pedition" Planned For UA4P In July; 70cm All-Mode Rig Needed

Noted DXers Jim Hartwell (K7UDG) and Gene Kestromin (UA4RZ) are presently in the final stages of organizing a "DX-pedition" to the Soviet Union commencing on July 4, 1989 in the city of Kazan, USSR and finishing near the Caspian Sea on July 16th. Jim, representing the Western Washington DX Club, and Gene, President of the Ziland DX Club, are happy to announce that they have recently received permission from CCCP (the Soviet "FCC equivalent") to also include AO-13 operations in this joint US-USSR "DX operation." Although the main emphasis of this DX effort will be on HF, UA4RZ says that AO-13 operations will also be included whenever AO-13 is visible and Mode B or Mode JL operation is possible. All the necessary antennas are being constructed by the Ziland DX Club and they presently have a 2m all-mode "homebrew" transceiver. Because of the difficulty the members of the Ziland DX Club have in obtaining commercial UHF equipment and even harder time obtaining parts in order to construct a 70cm rig, Jim Hartwell (K7UDG) would like to make an appeal to all OSCAR satellite users who might be

willing to donate a 70cm all-mode transceiver to the Ziland DX Club. Jim wants to emphasis that once this joint US-USSR "DX-pedition" is over, the "donated" 70cm rig will become part of a PERMANENT AO-13 station in the Ziland DX Club in Kazan. UA4RZ has indicated that the Ziland DX Club is about to acquire a "rather old" IBM PC which will be used to track AO-13 and RS 10/11. The Ziland DX Club currently consists of about 100 active members who are very excited about the possibility of working AO-13 from their club station, UA4P. Gene also says that the CCCP has also given them permission to use the AMSAT MICROSAT/PACSATs which are scheduled to be launched later this year aboard a ARIANE IV rocket. But without a UHF rig, not only will the AO-13 "DX operation" from the city of Kazan not be possible, but there will be one less AO-13 station active from the USSR. If you own a "spare" 70cm all-mode rig which you are not currently using and or you wish to donate to this worthy cause, please get in touch with:

SILVER SPRING, MD APRIL 28, 1989
TO ALL RADIO AMATEURS BT

MICROSAT Progress Report #3 From the MICROSAT LAB In Boulder, CO

Jeff Zerr, AMSAT-NA's Engineer in Charge of Mechanical Assembly has the following items to report from the MICROSAT Laboratory located in Boulder, CO:

1) AMSAT-NA has taken delivery on the first of four "custom built" carrying-cases which will be used to transport each of the four MICROSATs to Kourou, Fr. Guiana. These little "suitcases" had to be specially designed to hold the MICROSATs on a carefully designed plat-form that has its own "shock-absorbers." Jeff reports that they are pleased with the design of the carrying-cases. Each case measures 2.5 ft by 1.5 ft by 1.5 ft.

2) All of the solar arrays have been mounted to the "honey-comb" panels for all of the four MICROSATs. They have also been "electrically" wired together. Jeff points out that "sodering" the wires to each of the panels was an extremely delicate operation. If too much heat is applied, the solar cell "clip" will crack.

3) All the transmitter modules are coming together quite nicely. The electrical parts are being procured. Custom made "standoffs" were

completed which will hold the circuit boards inside the small 1 inch thick modules.

4) One of the results of the "battery fit check" was that there was a "clearance" problem which had to be resolved. Jeff reports that the battery "cradles" have been reworked and an "extra" 1.5 mm was found to solve the problem. The batteries are glued into their respective "cradles."

5) Flight prototype printed circuit boards have been completed by Matjaz Vidmar, YT3MV, for both the 70cm transmitter and the 2m transmitter.

6) The onboard digital computer has now moved from the design phase, "bread-board phase," and is now being fabricated and is ready to be installed into the first MICROSAT.

Jeff says that the final integration date of each of the MICROSATs is still May 15, 1989. Volunteers are very much needed; you don't have to live in Colorado to make a contribution to the MICROSAT construction effort. If you would like to help AMSAT-NA in this construction effort, contact Jeff Zerr at (301) 530-7233.

AO-13 OPERATIONS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 118.04 FROM AMSAT HQ
SILVER SPRING, MD APRIL 28, 1989
TO ALL RADIO AMATEURS BT

AO-13 Operations Net Schedule For May & June

Many AO-13 users are unaware that there is an AMSAT Operations Net which is conducted on AO-13 several times each month to help answer questions about OSCAR satellites and to provide information about the many exciting things going on in AMSAT. The following is a list of the times for the Ops Net. Please place this list in a convenient place in your OSCAR station so that you won't miss out on this interesting net which is offered as a service to all AMSAT members.

Here is the Ops Net schedule through June:

Date UTC orb-phs NCS
29 Apr 1700 671-231 WA5ZIB (45 minutes)

*** satellite schedule and orientation change anticipated ***

07 May 0300 687-116 N5BF (06 May local time, U.S.)
14 May 0400 702-056 N5BF (13 May local time, U.S.)
21 May 0200 716-188 (20 May local)
28 May 0200 731-105 (27 May local)

04 Jun 0300 746-045 (03 Jun local)
11 Jun 0000 760-152 (10 Jun local)
18 Jun 0100 775-092 W0RPK (17 Jun local)
25 Jun 0300 790-055 (24 Jun local)

Nets can be held on B or JL, but if the AO-13 satellite schedule is changed such that the Ops Net falls during an "off" period, it will be rescheduled. Frequencies are 145.950 MHz up and 435.970 MHz up. All these are for AO-13, but AO-10 is sometimes used, when available.

Again, the scheduling constraints now used are:

1) The satellite(s) used will be in view of at least the 48 states at the beginning of the Net and for 45 minutes thereafter.
2) The Ops Net will not start before 5 A.M. Pacific time.
3) The Ops Net will not start after midnight Eastern time.

AMSAT SHORT BURSTS

HR AMSAT NEWS SERVICE BULLETIN 118.06 FROM AMSAT HQ
SILVER SPRING, MD APRIL 28, 1989
TO ALL RADIO AMATEURS BT

Short Bursts

On May 3, 1989 there will commence a spacecraft attitude change for AO-13 in order to compensate for changing sun angles. This will

necessitate a transponder schedule change in order to readjust the Mode JL operating time. The new schedule is as follows:

de VK5AGR 15Apr89: *** AO-13 TRANSPONDER SCHEDULE ***
Until 03May89 ! 03May89 to 14Jun89
Mode-B : from MA 100 to MA 160 ! from MA 3 to MA 160
Mode-JL : from MA 160 to MA 200 ! from MA 160 to MA 200
Mode-B : from MA 200 to MA 256 ! from MA 200 to MA 240
OFF : from MA 0 to MA 100 ! from MA 240 to MA 3
Mode S Beacon 2400.661MHz ON from MA 210 to MA 222 every orbit.
03Apr89: ALON/ALAT 212.0/+2.0 drift 0.016/-0.061 deg/day.

Space Shuttle Astronaut Ken Cameron recently passed his Amateur Extra Class license and became KB5AWP. Ken is presently scheduled to fly on STS-37 which has a planned lift-off date of April 5, 1990. Under the "tutelage" of AMSAT-NA member Lou McFadden, W5DID, Ken was able to "swoop" through all the various parts of the licensing process. Look for Ken's call sometime in the near future: "This is KB5AWP/Space Mobile."

Roy Welch, W0SL, has just recently finished putting the "finishing touches" on his ORBITS II, ORBITS III, and ORBITS IV satellite tracking programs. One of the most notable aspects of the ORBITS IV program is that it will support VGA graphics monitors. If you would like to find out more about these fine tracking programs and the features which they possess, send a s.a.s.e. to:

AMSAT & DAYTON A GREAT SUCCESS

HR AMSAT NEWS SERVICE BULLETIN 126.01 FROM AMSAT HQ
SILVER SPRING, MD MAY 6, 1989
TO ALL RADIO AMATEURS BT

The Dayton Hamvention '89 Was The "Finest" In AMSAT-NA History

AMSAT-NA President, Doug Loughmiller (KO5I), is proud to announce that "this was the finest Dayton Hamvention that AMSAT-NA has ever participated in." The list of volunteers supporting Doug at the AMSAT booth reads like a "Who's Who in AMSAT" with the following volunteers: John Champa (K8OCL), Tom Clark (W3IWI), Sue Crabtree (N0GUT), Jack Crabtree (AA0P), Ron Curry (WA4GSS), Courtney Duncan (N5BF), Rich Ensign (N8IWJ),

Dave Filmer (WB9QBP), John Henry (VE2VQ), Jan King (W3GEY), Larry Koziel (K8MU), K.O. Lerner (K9PVW), Bob McGwier (N4HY), Keith Pugh (W5IU), Bob Rogers (W8JLE), Roy Welch (W0SL), and Jim White (WD0E). So intense was the attention given to the AMSAT booth by the attendees of the Hamvention, it was evident that there was always a major "traffic jam" in front of the AMSAT booth. Many a passerby was unable to resist the urge to come by to gaze at the MICROSAT model and also to stare intently at the computer monitors "showing off" QUIKTRAK 4.0 (QT 4.0) and ORBITS IV satellite tracking programs. The MICROSAT model used at Dayton was the vibration "test" prototype which had real solar cells and real antennas. Only the "innards" were fake. Many an amateur who had previously been uninterested in OSCAR satellites found themselves leaving the AMSAT booth not only a member but also with a copy of QT 4.0 in hand. Over 140 new members were signed up. In addition to satellite tracking software being a "big hit" at the AMSAT booth, so was the "A Beginners Guide to AO-13" authored by Keith Bergland, WB5ZDP. During the Hamvention AMSAT sponsored several well attended forums dealing with everything from "getting beginners started on AO-13" to MICROSATs to the Phase IV Geostationary satellite concept; the speakers were: K8OCL, W3IWI, N5BF, W5IU, W3GEY, KO5I, and N4HY with AA0P acting as "Master-of-Ceremonies" for each of the forums. In general, the enthusiasm shown for AMSAT at Dayton left little doubt that the amateur radio community supports AMSAT in all its major endeavors from MICROSATs to Phase IV. Doug Loughmiller would like to thank all those who came by the AMSAT booth to say hello and helped to make this the best Dayton Hamvention AMSAT-NA has ever had.

MICROSAT BANDPLAN EXPLANATION

HR AMSAT NEWS SERVICE BULLETIN 126.02 FROM AMSAT HQ
SILVER SPRING, MD MAY 6, 1989
TO ALL RADIO AMATEURS BT

MICROSAT/LUSAT/PACSAT Frequency Selection Done With Great Care

It has been brought to the attention of AMSAT-NA officials that there is a small but vocal minority of radio amateurs who have been questioning the MICROSAT/LUSAT/PACSAT frequency bandplan. As has been announced in articles in AMSAT-NA Journal and "73 Magazine," the uplink frequencies for LUSAT will be the following: 145.840 MHz, 145.860 MHz, 145.880 MHz, and 145.900 MHz; for PACSAT the uplink frequencies will be 145.900 MHz, 145.920 MHz, 145.940 MHz, and 145.960 MHz. The downlink frequencies for LUSAT and PACSAT will be 437.150 MHz and 437.050 MHz, respectively. AMSAT-NA officials wish to briefly explain the logic for choosing these frequencies for these "store-and-forward" OSCAR satellites.

LUSAT/PACSAT uplink frequencies are all located within the portion of the 2M spectrum designated for the "Amateur Satellite Service" which on 2M includes 145.800-146.000 MHz and on 70cm it includes 435.000-438.000 MHz. Currently the following OSCAR satellites use these frequencies: AO-10, AO-13, FO-12, UO-9, UO-11, and to a limited degree, RS 10/11. However, in

many parts of the world, the portion of the spectrum from 145.800-146.000 MHz is heavily populated and virtually unprotected. For example, many amateurs point to the "chaotic" conditions which exist on 2M in Japan. When JARL and JAMSAT were designing FO-12, such heavy QRM problems where considered very carefully. When the designers of the PACSATs also looked at the QRM problem, they too came to the conclusion that Mode JD was the way to go.

From an equipment standpoint, using Mode JD will allow many OSCAR satellite users to use the same equipment they have available for MODE B operations. It should be noted that on the uplink, packets can be sent with a just a few watts from a 2m FM tranceiver. Since most amateurs generally own a 2M FM tranceiver and a HF rig, obtaining a 70cm converter is an easy way to build a "basic" PACSAT station. Thus the designers of the PACSATs felt that Mode JD was a relatively "cheap" way to go for those who wanted to get started on PACSAT operations.

As far as the actual choice of the frequencies for the uplinks to LUSAT and PACSAT, you will notice that they are located on "opposite ends of the spectrum." The decision by the designers to do this was based mostly on considerations of "orbital dynamics." Because all of the MICROSATs will be "dropped off" from the ARIANE rocket at the same time, it will take many months before they "spread out" to the point that they don't all appear in the sky at the same time over a ground station. In order to avoid having users of LUSAT and PACSAT interfering each other during these first several months, the frequencies for the uplinks had to be widely spaced.

As far as PACSAT users interfering with AO-10, AO-13, and the rest of OSCAR satellites, the best possible passes for the MICROSATs will be less than 17 minutes for an "over-head" pass. This means that there will be a potential of 45 minutes worth of QRM. But as everyone who works packet radio knows, packets are by nature very short bursts. Anyone who has listened to FO-12 will also be aware that 90% of the transmissions are very short. Another important consideration is that the PACSATs will NOT allow digipeating. They will only take messages for storage and allow users to read "mail" directed to them or "unconnected" telemetry packets. This provision for not allowing digipeating will help reduce any possibility of QRM caused by unattended beacons.

The final concern is that once radio amateurs hear packets being sent on the satellite "sub-band" of 2M, that terrestrial "packeteers" will also start sending their packets within the 145.800-146.000 MHz spectrum. To the best knowledge of AMSAT-NA officials, this has not happened with current set of OSCAR satellite frequencies and it is not expected to occur when the new PACSATs are launched. Because the equipment to send PSK packets to the PACSATs is quite different from the AFSK packets sent terrestrially, it would appears unlikely that such an "encroachment" would occur on the satellite "sub-band." In general, amateurs hold very strongly to "gentleman" agreements concerning bandplans.

It is hoped that this short discussion here about MICROSAT bandplan can put to "rest" any lingering questions about this issue. In up coming issues of QEX magazine and ASR, Bob McGwier will be discussing this important topic in great detail. In between time, if you have further concerns or comments, please send them to:

Bob McGwier, N4HY
15 Cherrybrook Lane
East Windsor, NJ
08520

SILVER SPRING, MD MAY 6, 1989
TO ALL RADIO AMATEURS BT

AO-13 Transponder Schedule Change Occurred On May 3, 1989

On May 3, 1989 AO-13's operating schedule was changed by AMSAT ground command station VK5AGR due to the fact that the solar eclipes in which AO-13 had been experiencing have ended for the time being. On June 14, 1989 an attitude change will commence in order to adjust AO-13's attitude to the following Bahn Coordinates: BLONG=180 deg, BLAT=0 deg. This attitude change on June 14th will be performed in order to keep the high-gain antennas "pointing at the earth's center" at apogee. This will also improve "squint" angles for the larger part of each orbit. But until June 14, 1989, please be advised that the transponder operating schedule for AO-13 is the following:

de VK5AGR 15Apr89: *** AO-13 TRANSPONDER SCHEDULE ***
03May89 to 14Jun89

Mode-B : from MA 003 to MA 160
Mode-JL : from MA 160 to MA 200
Mode-B : from MA 200 to MA 240
OFF : from MA 240 to MA 003

Mode S Beacon 2400.661MHz is ON from MA 210 to MA 222 every orbit.
29Apr89: BLON/BLAT 211.8/+3.3 with a drift rate of 0.016/-0.061 deg/day.

The FO-12 downlink is 1200 bps BPSK. The same format will be used for the
Microsats. The RadioKit modem is in fact the G3RUH kit. However, there is
another kit available from AMSAT and TAPR which is demonstrably superior to
the G3RUH design. It is based on a Japanese design, with some tweaking by
some of the TAPR folks. It also includes the Manchester encoder needed for
the 1200 bps FO-12 & Microsat uplinks. I homebrewed a modem from the
original JA design, and was very impressed with it. In the early days of
mode JD, before they started up the mailbox software, I worked 9 different
countries using the satellite as a digipeater (which probably makes me the
"packet satellite DX King" - any challengers?). :-)

The PSK modem bears some resemblance to a Bell 212, but the latter is a
600 Baud QPSK modem, so they certainly aren't compatible.

BOOK REVIEW: ANARC GUIDE TO U.S. MONITORING LAWS

by Bob Parnass, AJ9S

Do you as a monitoring hobbyist have the right to receive whatever radio signals you want in the privacy of your own home? No -- not any more. So say the infamous Electronic Communications Privacy Act of 1986 and a growing number of state laws which took away this freedom. You can find out about these restrictions in a new 39 page paperback, ANARC Guide to U. S. Monitoring Laws.

If you are new to the radio hobby, you might not be familiar with ANARC. ANARC is not a company. ANARC is the Association of North American Radio Clubs, a well intentioned umbrella organization of volunteers who look out for the best interests of shortwave and scanner listeners as well as TV, FM, and MW DXers. With the able Bob Horvitz at the helm, ANARC led the fight against ECPA, against FCC proposals to let Part 15 devices run hog wild over the spectrum, and other issues of concern to radio hobbyists.

The ANARC guide presents the text of the ECPA and the restrictive anti scanner laws of 14 states. Author Frank Terranella, ANARC's legal counsel and a radio hobbyist from New Jersey, does a good job of translating the legalese jargon into understandable English for the average person. He even cites a few real cases in which the laws were applied.

The guide sells for $7.50, over 19 cents per page. This may seem expensive, but where else can you get all this legal information in one place? I've seen only one source which surveyed radio listening laws. Several years ago, before ECPA, Bearcat's SCAN organization published a small pamphlet with very terse summaries of state scanner laws.

As the author laments in the foreword, "it is unfortunate that a guide such as this is necessary." Do you need this guide? I think you do. Before you bring a scanner along on vacation, you ought to know the scanner laws in the states through which you drive. Being a ham radio

operator exempts you from Indiana's mobile scanner law, but it would be a good idea to carry a copy of the law in your car to show police if stopped. I recall when WA2PVK had a 19" whip on his car, and was stopped by a policeman in New Jersey to see if his car contained a scanner. New Jersey doesn't exempt hams.

The ECPA stirred up a hornet's net of protest, but hobbyists couldn't compete with powerful, well funded lobbyists. It's too late to argue whether ECPA is right or wrong -- it's law now. Several radio laws are difficult to understand and the hobby needs an author skilled in the legal profession and familiar with radio monitoring to explain them. This book suits the need well.

ANARC Guide to U.S. Monitoring Laws is available for $7.50 from ANARC Publications, P.O. Box 462, Northfield, MN 55057.

Subject: Hole in the wall

Though not a construction expert, I have not found any solution to your problem short of cutting a hole in the wall where you wish to penetrate the joist(s), drill or cut (with a hole saw) through the joist, then repairing the hole in the wall. This method has been confirmed by two construction contractors who should know if there were an easy solution.

Of note, even if you rigged the pipe with teeth to be chucked, you would probably have to take the roof off to feed it vertically down thru the wall!

Common duct putty, obtainable at any building supply house, is appropriate for sealing the pipe. It is similiar to coax seal but not as sticky, takes a long time to harden (years) but provides an airtight and rodent resistant seal.
Good luck.

Our club, the Rochester VHF Group, is trying to answer some of this need in just the manner you suggest. We have done a design of a 903 MHz transverter which, while maybe more sophisticated than would be necessary to get started on the band, is a state of the art unit which could be used for any type of operation from weak signal CW/SSB to NB (or even WB) FM. We will be marketing the kits at our cost, which will be in the $100 range. Anyone with any type of 2m rig could thus get on the 33cm band.

Also, the North Texas Microwave Society is doing their part. They offer a set of boards for an excellent 1296 MHz transverter, again using 2m as the IF.

Bottom line- there is no reason that we can't greatly increase the ham population and experimentation levels on these bands. We don't need to wait for the "big three" to perceive a need for equipment.

I almost forgot- Down East Microwave has just begun marketing transverter kits for 2304 and 3456 MHz. These are state of the art designs using 2m

as the IF and requiring NO TWEAKING to get them running! Prices are good too- under $200 complete. Now I know, this isn't "rolling your own", but it's close. And for those who are afraid of trying to work with microwave circuits, the transverters I mentioned are a good way to get "initiated" to the world above 30 MHz.

Hope this helps and maybe spurs some people to give these VERY under-used bands a try.

Give me a break! I suppose you guys turn off the TV set when a pretty girl
is selling Coke or Chevys, too!!!

Guys, what you saw is called MARKETING!!! Now, you may not like it, and
certainly no body at Dayton forced you to buy an Azimuth clock or Weather
Station- as a matter of fact, no body forced you to look at their booth-
but I bet when you heard their was a pretty girl in a bathing suit
getting her picture taken with a bunch of other hams, you made your
way over there fairly quickly! Nothing wrong with that, most of the other
40,000 at Dayton did the same thing.

I seriously doubt that "a lot of women" were upset by the girl- matter
of fact, it was a woman who told me about it- Evelyn Garrison of Icom,
or I probably would have missed it- I hadn't found that part of the
arena.

The point is, Azimuth managed to sell what otherwise was just another
clock, by using a marketing technique. This is a free enterprise,
capitalist society. What they did was neither illegal, immoral, nor
in all that bad taste- at least she was pretty :^)!

If you really are offended by such displays, then I suggest you start
working to stop them where they begin- on TV. I meant what I said

about turning off the tube at the sight of such commercials- if you are NOT doing this, then I say you are a hypocrite. If you really are working for change in this area, then contact Azimuth and let them know, so they won't do it again. But I'll tell you this- they sold one Hell of a lot of clocks at Dayton, so I suspect it will be tough to convince them that you're right.

829. Do you remember the GE Progress Line???

Newsgroup: rec.ham-radio
Date: 1989-05-11 16:00:46 UTC
From: tech@cs.AthabascaU.CA
Message-ID: <920@auvax.AthabascaU.CA>
Source record: 18603

I have had a GE Progrss Line cluttering my basement for six years now and so I thought I would clutter my trunk with it. The car is a 77 Mercury Marquis so they really have a lot in common.

Since just wiring the rig in and using it is boring I thought I would modify it it for 6 channel operation by removing the 12AX7 xtal oscillators (or is it a 12AT7? No matter.) in the tx and rx strips and putting in a small transistor osicllator circuit board in the now empty space. I would then run another cable in parallel to the main control head cable and replace the present power light and channel switch with a 6 position switch and a seven segment display chip.

This is all being thought of without looking inside the boxes or reading the schematics... Any of you see any potential pitfalls that might await me. What other interesting mods and/or references should I look into?

Oh yes, I know I can buy a synthesized rice box for little more than the price of the 12 crystals but actually 2M FM is not very interesting and rebuilding old equipment is very interesting.

Do you think I can make a Progress line switch fast enough to run packet?

Source record: 18605

The 21.1 to 21.2 MHz band is a Novice CW band for US amateurs. However, other countries have adopted different allocations of modes for that band. Many countries do not restrict specific modes to sub bands, but allow the amateur to choose from the acceptable modes. I suspect you are hearing from South America. I have heard/worked a large number of those stations in that sub band.

>microprocessor or memory anywhere to be seen, but remember it only cost
>you fifty dollars!

Sure, the parts cost is $50. But what you're forgetting here is that 1) most hams don't have access to said documents, and couldn't use them if they did, and 2) those who do have access to said documents are usually quite busy making a living (or trying to hack a thesis). And, once you're done, chances are what you have isn't as portable as one of the ricerigs.

I wouldn't mind seeing more experimentation on the amateur bands, but stop harping on the "users" -- who are usually doing something else productive.

> see as the cause of "loss of" vertical resolution?? Seems to me that's

There are possibly two delay lines in the luminance channel, one
of which is used for chrominance/luminance separation (so-called "comb"
color separation) and one of which is used for delay equalisation. The
first delay line is a 1-H delay.

Since comb separation requires averaging adjacent lines, this
most assuredly causes a loss in vertical resolution.

>
> Does anyone know of any Ham-fests scheduled to take place in
> the Washington DC area?

Washington D.C. area hamfest list (tentative dates).

I have extrapolated these dates from last year's list to
this year's calendar. The dates may not be accurate, but
with 12 years of hamfest experience around this area,
there is a good possibility that these are accurate.

May 28 Howard County, MD: Maryland FM Association; although
I don't have a write-up here listing this one,
it is one of four hamfests traditionally held
at this site off Route 40/144/I-70 @ Rt 32. Moderate
turnout if weather is good (everyone at the beach),
moderate turnout if weather is bad (who wants
to hamfest in the rain?).
Talk-in: 146.76, 146.52

June 4 Manassas, VA: Ole Virginia Hams; at the Prince William
County fairgrounds, Route 234 south of Manassas, Va.
W4PVA, "he does from his home, through the relay station
there" on his bicycle. Bigger each year; tailgating
in huge grassy field.
Talk-in: 146.97, 146.52

July 30 Howard County, MD: Baltimore Radio Amateur Television Society???;
another one of the four hamfests held at this site (see
May 28 above). A good, hot, buggy, local-type hamfest
which grows a little larger each year. Get there early
to beat the heat and gnats.
Talk-in: 146.76?, 147.03?, 146.52

August 6 Winchester/Berryville, VA: Shenandoah Valley ARC;
Clarke County Ruritan Fairgrounds just off Route 7
2 miles west of the town of Berryville, Va. Enjoy
a beautiful day in the Virginny hills, have a
barbecue chicken half, catch up on 6 meteors with
Jethro and Capt. Kirkwood, and buy some junk!
Talk-in: 146.82, 146.52

836. 220 MHz Hearing in Washington D.C.

Newsgroup: rec.ham-radio
Date: 1989-05-11 20:12:51 UTC
From: albers@ka3ovk.UUCP
Message-ID: <5300@ka3ovk.UUCP>
Source record: 18610
Cross-posted to: rec.ham-radio,rec.ham-radio.packet

Well, I got back a few hours ago from the above. From what I saw (from the back row), the comission that was conducting the hearing was for the most part much in favor of hams. There were 4 'witnesses': The ARRL, the FCC, UPS, and DOD. Each was allowed time for testimony, and then each member of the comission was givin time to ask questions at the end of each witnesses testimony.
I didn't take notes, but here are some of the high points:

The ARRL described activity on 220, and brought along a packet station. One of their main points was that only on 220 is the channels for wide-band packet, and this is now done in the portion that the FCC took. Also they talked about expense and trouble of re-allocating present stations (FM, packet, EME, etc....), and related this to a game of musical chairs, with the FCC yanking the chairs away.. There was a lot more, and I expect to hear from Chris Imlay later this week with more info...

The FCC was up next, and was quite comical. One of the best laughs was when they were asked if they had tried to find other alternatives to taking away part of 220 -- "Well.....". Also they were forces to admit that they based their idea of the usage of the 220 band on an old copy of the repeater handbook -- stress old. (The ARRL explained eariler that the direcory does not list everything, and lists NOTHING about what's below the repeater allocations).

UPS was very frank -- they didn't care what frequencys they got, as long as they got them, and if the FCC assinged something else, it wouldn't cost them much to change their plans.

DOD came out in support of the amateurs -- they said the FCC had been given comments, but had choosen to ignore them...

Those were my impressions. I think the comission is going to ask the FCC to reconsider, but no decisions were officially given today..

Keep your fingers crossed.....

There were quite a few terms which I collected over past few weeks, that
I don't understand is :

BAOUT
/* End of text from uxa.cso.uiuc.edu:rec.ham-radio */

I think that you have mistyped/misread the word "baudot". This is a digital
form of representing characters using 5 bits. 5 bits allow 32 different
characters, so you get all 26 capital letters and a few punctuation marks.
This system is older and less popular than ASCII, the standard for almost all
computers, which uses 7 bits allowing all letters, punctuation, and many
special characters.

838. Yaesu's poor choice of 17.3 Mhz

Newsgroup: rec.ham-radio
Date: 1989-05-11 22:17:00 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500032@ux1.cso.uiuc.edu>
Source record: 18612

Since 145.25 Mhz (mostly due to cable leakage) and 162.55 Mhz (WX radio in many areas) are predominant in this country, Yaesu's choice of 17.3 Mhz for an I.F. frequency was a real fubar.

Something I am wondering about: When I first learned how radios worked, radios with I.F. that is, I learned that there was a preselector circuit ahead of the first mixer so that neither the image signal nor cross mod products would be introduced into the I.F. stage. This circuit is also tuned along with the L.O. frequency so that its bandpass center is on the desired frequency. I never learned how that tuning was kept together. However it was obvious to me that the bandpass had to be at least as narrow as the I.F. frequency itself. So for a 10.7 Mhz I.F. common in FM broadcast receivers, a bandwidth of less than 10.7 was necessary to prevent signals from mixing together and getting into the I.F. stage. Since the band is 20 Mhz wide, tuning the front end preselector is necessary.

I have noticed a lot of radio designs these days with no front end preselector at all, or if there is one, it is a fixed bandpass and is very very wide. It seems that radios are just being made cheaper and cheaper and cheaper.

This must be why so many TV sets are picking up signals on so many different ham bands. I'm sure consumer products are even cheaper than ham products.

>I think the phone company has done most of this for us. Lets go out and
>buy a microwave tower and an old pbx switch.

Nope. :-) Notice I specifically said PACKET voice, with DYNAMIC
bandwidth sharing. Telephone networks use circuit switching, with static
bandwidth allocation. Packet voice allows you to share bandwidth on a
statistical basis, and to use voice coders whose output rate varies over
time according to the input signal (and whether the person is talking or
not). Significant bandwidth savings are possible.

An integrated pure-packet-switched voice/data communication system would be
a noteworthy achievement even outside amateur radio.

WHAT IS AMATEUR RADIO?

Amateur Radio is a hobby! Also known as "Ham Radio", Amateur Radio is a service very much in the public interest. Since the earliest days of radio, hams have made important service and technical contributions to the world - the Amateur Radio operator is a sophisticated, well- trained communications technician!

There are currently over one and a half million licensed Amateurs operators worldwide. Hams' contributions in providing disaster communications have caused ham radio operators to be acknowledged by their governments as a source of technical and communications skills, especially during emergencies. Less known, but equally important, is the tremendous international value that is implicit in hams' unique, "people-to-people" activities. The Ham Radio fraternity is one that doesn't know any geographic, political, or social barriers!

TUNE IN THE WORLD!

Through Amateur Radio, you can be in touch with hams all over the United States, North America, and the entire world! This year, RIT Amateur Radio Club members regularly talked with Amateurs in countries like Brazil, Great Britain, France, and even the Soviet Union!

PUBLIC SERVICE EXCELLENCY

Amateur Radio has long been recognized as a critical resource during communications emergencies. Natural disasters, like the recent Soviet Earthquake, can completely wipe out the normal channels of communication. Amateur Radio is here to provide critical support to emergency relief crews.

Did you know that Amateur Radio is working for the public every day of the year? Through Amateurs, ordinary people can send messages to friends and family through the NationalTraffic We can send your message to anybody, almost anywhere in the world, for free! This service, similar to Western Union (only free of charge) is available to you, NOW! Contact the Amateur Radio Club for further information. Anybody can become a ham!

A HIGH-TECH HOBBY - AMATEUR RADIO GOES INTO SPACE!

The world's first non-government satellite carried the voice of Amateur Radio operators around the world! Amateur Radio is the high-tech sport of communication. RIT Amateur Radio Club operators have even experimented with advanced techniques, including tracking these satellites around the world, and even bouncing our radio signals off of the face of the moon!

FOR MORE INFORMATION:

To find out how you can become an Amateur Radio operator, please contact us by telephone, electronic mail, or stop by our club station. The K2GXT office is located under the C.U., between the gym and the Ritz, right next door to W.I.T.R.

Today I heard several SSB phone stations between 21.1 and 21.2 MHz -
Among them was a British ham (I think) operating just below 21.2 MHz.
Does anyone know if the band allocations in the UK (or anywhere else,
for that matter) allow phone operation between those frequencies?

SUBJECT: Amateur Radio - Communications or Technology.

Does anyone out there actually BUILD gear any more? Almost all the hams i get to talk to nowadays can do nothing but quote 'rice box' model numbers at me and little else. Do we all have too much money (i certainly dont!!). Whats happened to the true spirit of amateur radio - it always used to be said that a true engineer could make for a dime what everyone else would charge ten dollars for. Are there any people out there who can wield a soldering iron or have we all become 'appliance operators' who just press buttons?

Think about it - when did *YOU* last *BUILD* something......
Hands up anyone who hasnt got a soldering iron and an oscilloscope in the shack......

(pause for red faces to return to normal color).

Even if its only building a simple direct conversion receiver for 20 meters, you can say 'you did it yourself'. I feel that we have grown complacent in our old age (and lets face it, the age profile of hams gets older every year) and it doesnt indicate a healthy future for the ham movement as a whole. Arguments such as 'code vs no-code' dont do the movement much benefit in the public eye either. Instead of having different classes of license on the basis of code speed amongst other things (this is as silly as basing it on your ability to run marathons!) why not have 'technical competence' (i.e. give the guy a TVI problem and a box of filters and let him try and solve it!)

A parable::

'And it came to pass that there was once a number of radio amateurs. They spent all their money buying expensive commercial radios, for, having not the wisdom to build their own, there was little else for them to do. And with these commercial radios, which runneth over with features, they indulged in banal contests and the exchange of serial numbers, and bewailed the benefits of code vs. no-code. One day, an upswell of enthusiasm for the microprocessor seized all the hams, and they all spent even more of the money, which they id not really have, on synthesizers, TNCs, computers and personal computers. They talked amongst each other about TCP/IP and NETROM and digipeaters, until they were blue in the face. Then one day, a big bad commercial wolf came along and listened to the babble across the spectrum. 'This is wasting valuable spectrum which i could SELL!' he said to himself, and so after a period of reasoning with the Gods of Spectrum Allocation, he was given huge swathes of the amateur bands in which to practice his commerce. The hams beat their chests and cried in the wilderness, for their allocations were sorely reduced, yet they changed not their ways. The prophets did say 'get thy act together, or all will be lost', but though the

hams were sore afraid, they changed not their ways until it were too late, for by then all their spectrum had been torn from them'

On board PC-1, measure the frequency of crystal X2,
a local oscillator. It should oscillate at 48.045 MHz.

This local oscillator signal is mixed with 48.5 MHz
in IC2 to generate a final IF of 455 kHz.

(Member of Radio Communications Assc. IL-267)

>
Yes, there are 50 Ohm and 75 Ohm versions of both BNC and Type N type connectors. Get hold of a copy of the Amphenol catalogue. Or wander into a parts store and look at their catalogues. Type N 75 Ohm connectors will screw on to 50 Ohm jacks, but the center pin will not mate.

The holes in the back are no indication of the impedance. There are some with tiny (about 3 mm) holes for RG-174 (50 Ohm) and some with bloody great holes (about 10 mm) for RG-8 (50 Ohm).

You mention RG-62 which is 90 Ohm cable, I am not sure if there are 90 Ohm BNCs, but their may be. The model number on the connector will tell you what impedance it is and which cable it is designed for if you get a look at the catty.

Alas, coax conmnectors, like coax need checking in the catty if you are not familiar with them. I have "lost" my Amphenol catty in the garage, so I can not be more specific. But I have found my Belden cable catty which makes me happy. The moral of this is: If your marriage goes in the toilet, you keep the house then you will have somewhere for the ham stuff.

Yours

Fred-

What you are probably hearing is stations outside the U.S.

Many countries (most, in fact, other than the U.S.), have phone priveledges extending below 21.2 MHz. The reason we don't is to protect the 15m Novice segment of the band from strong Stateside QRM.

Fortunately, most of these stations, as you have observed, stay above 21.150. The best part of the 15m Novice band is and always has been the segment from 21.100 to 21.150, because of this situation.

It is also possible that you have found some South of the Border pirates. No flames or accusations here, but some of those guys DO operate in the 15m band, and the Novice segment is generally less populated than other portions of the band. One of the good things about the current sunspot cycle is that the 15m band is open to someplace just about all the time- one of the bad things is that as a result, some people who operate (legally or otherwise) and normally don't get heard very far away, now are being heard all over the World.

Hope this helps. 73 Dave Hallidy KD5RO

853. Review - The New Radio Shack PRO-2005 Scanner

Newsgroup: rec.ham-radio
Date: 1989-05-12 16:50:06 UTC
From: parnass@ihuxz.ATT.COM
Message-ID: <4492@ihuxz.ATT.COM>
Source record: 18625

x-------------- CUT HERE ---------------------------------------x

- 1 -

THE RADIO SHACK PRO-2005 PROGRAMMABLE SCANNER

by Bob Parnass, AJ9S

Manufactured in Japan by General Research Electronics, the Radio Shack PRO-2005 is a 400 channel, wide coverage scanner radio, incorporating NBFM, WBFM, and AM modes. It is the successor to the PRO-2004, the super scanner which put Radio Shack out in front of its competition in the base station scanner market.

The 2005 is basically a 400 channel PRO-2004, built using surface mount components, and housed in a smaller package.

Frequency Coverage

Radio Shack's last minute decision to remove cellular telephone frequency coverage from the PRO-2004 caused a 7 week delay in its introduction. The PRO-2005 appeared in the stores promptly on the heels of the 2004 closeout sale. Both the PRO-2004 and PRO-2005 cover 25-520 and 760-1300 MHz, except for 2 gaps in the cellular telephone bands. The two gaps in the 800 MHz range can be restored in either scanner by clipping a diode.

A matrix of diodes, attached to the microprocessor's input port, is often used to configure radios for sale in different markets. The diode matrix on new the PRO-2005 is located on the vertical circuit board just behind the front panel. There are 2 diodes present, and holes drilled for 2 more.

Lots of Memory

The PRO-2005 has the usual features that scanner buffs have come to expect: individual channel lockouts, selectable rescan delay, an external speaker jack, etc. But, the 400 channel capacity of the PRO-2005 sets another an industry record, just as the 300 channel PRO-2004 did! Casual scanner users may scoff at the usefulness of having so many channels, but seasoned monitorists can have those channels filled up in no time flat, espe-

cially with frequencies in the vast 225-400 MHz military air band, and other federal government allocations.

With so many channels to program, one dreads the thought of a power failure, which could clear memory in a hurry. Not to worry, the PRO-2005 memory is backed up by a

conventional 9 volt alkaline battery (not supplied). The 400 channels are divided into 10 banks of 40 channels each, and one can select or deselect any channel bank from the scan list. Individual channels can be locked out in the customary way, but the PRO-2005 maintains the handy feature introduced in the PRO-2004, a LOCKOUT REVIEW. Successive depressions of this key step through the locked out channels.

Scanners worth their keep have a priority feature, with channel 1 usually designated the priority channel. The PRO-2005 is more flexible; any of the 400 channels may be designated the priority channel. When the PRIORITY key is depressed, that channel will be sampled every 2 seconds, and the radio will stay there if a signal is heard.

The PRO-2005 has two scan speeds, approximately 8 and 16 channels/second, although one would probably use the faster speed in most instances. This is the same speed as the stock PRO-2004, as measured by your reviewer. A diode could be added to the PRO-2004 diode matrix to speed up the scan and search rates by 25%. The provision for extra diodes in the diode matrix makes one hopeful that the same speedup trick can be applied to the newer PRO-2005.

When programming a channel, the PRO-2005 firmware sets the mode automatically, based on its idea of what mode is most prevalent on that frequency. This feature saves extra keystrokes, and makes one appreciate the thought that went into the design of this radio. The default mode can be overridden easily, if need be, like to listen to a NBFM satellite in the 225-400 MHz range, which is mainly populated with AM signals.

Searching

The SEARCH facility found on most programmable scanners allows the entry of a pair of frequencies, then by pressing a key, the radio searches frequencies between those limits. The PRO-2005 allows for 10 pairs of limits! These pairs of limits are stored in their own memory, and don't use up any of the conventional 400 memory channels.

One can set up several search pairs, for instance:

- 46.610-46.970 MHz: cordless telephones

- 144-148 MHz: the 2 meter ham band

- 3 -

- 30.01-30.56, 32-33, 36-37 MHz: US Govt

Another unique feature is the MONITOR key, which stops the search and stores the frequency in one of ten special monitor memories. These memories are separate from the 400 main memory channels. The search can be restarted from where it left off by striking the up or down arrow key.

The user can select the search direction (up or down), and step size of 5, 12.5, or 50 kHz, although the PRO-2005 is intelligent enough to select a default step size based on the frequencies being searched. As on the PRO-2004, there is a hidden step size of 30 kHz, but apparently this step size was disabled when the cellular telephone frequency coverage was removed.

The selected parameters are displayed on the LCD panel, smaller than the panel in the PRO-2004. Search speed is switchable between slow and fast, with fast search being about 14 increments/second (versus 12 for the Uniden/Bearcat 800XLT). For a 12.5 kHz increment, this translates to 11.2 MHz/minute (versus 9.6 MHz/minute for the 800XLT).

The DIRECT key allows one to start searching up or down from whatever frequency is on the display. Let's say the scanner is in MANUAL mode, and set at channel 26, which contains 460.100 MHz. Striking the DIRECT then UP-ARROW keys starts the PRO-2005 searching upwards from 460.100. This is a nice feature.

The PRO-2005 contains a "window detector" circuit, which is called into play during a SEARCH operation. This circuit tries to detect when the radio is tuned close to the center frequency of a station, and prevents the search from halting prematurely, off to the side of the signal.

The AFC (automatic frequency control) circuit of the Bearcat 800XLT often causes a search of 850 MHz signals to halt prematurely. Even though the signal sounds on frequency, the display reads the wrong frequency. Neither the PRO-2004 nor the PRO-2005 have this problem.

The PRO-2005 includes a SOUND SQUELCH, resembling the VSC circuit on the Icom R-7000, which may be used during scan

or search operations. With the the sound squelch enabled, signified by a red lamp above the pushbutton, the scanner will skip over unmodulated signals. This is handy for skipping over "birdies", or link signals with a constant carrier.

- 4 -

The manual warns that the sound squelch may be fooled by signals with low modulation, and skip over them. The PRO-2005 SOUND SQUELCH tries to detect the presence or absence of modulation (not human speech), so unfortunately, it thinks that noisy dead carriers, digital data signals, and paging tones are worth monitoring and will stop the scanner to listen to them.

Taping Facility

A tape recorder can be connected to the TAPE phono jack on the rear panel, which provides 600 mV of audio at a 10,000 ohm impedance. An audio filtering circuit rolls off the high frequency components before they reach the TAPE jack, which makes it impossible to use it for picking off FM subcarrier signals. In addition to a rear mounted external speaker jack, there is a miniature headphone jack on the front of the scanner.

The PRO-2005 lacks a COR (carrier operated relay) output, like ICOM R7000 and older Bearcat 300 have, which would be useful for actuating a tape recorder.

Basic Performance

To evaluate sensitivity, the PRO-2005 was compared with it's father, the PRO-2004. Since a signal generator was not used, quantitative measurements could not be made. Instead, an Antenna Specialists AV-801 antenna was switched between radios, signals from stations were compared by ear, and the results tabulated.

Simply put, the PRO-2005 proved moderately more sensitive than the PRO-2004 on most bands tested, and just slightly more sensitive on a few bands. The cost one pays for the 2005's increased sensitivity is having to put up with hearing 800 MHz trunked systems and cellular telephone conversations while searching the 118 - 132 MHz commercial aircraft band. The 800 MHz interference was heard only on the 2005, not the 2004. Other than that, intermodulation interference from paging affected both scanners to the same degree, and on the same frequencies.

Although both the 2004 and 2005 can suffer the effects of intermod, they are much more immune than the overly sen-

sitive, image laden Bearcat 800XLT. The PRO-2005 has a 10 dB attenuator, operable by a slide switch on the rear.

- 5 -

The up conversion design of both the ICOM R-7000 and Radio Shack PRO-2005 allows use of a very high IF (intermediate frequency), which helps avoid image problems. The PRO-2004 owner's manual contains a frequency allocation chart and a section on images. This section appears in the manuals for other Radio Shack models, and was thoughtlessly thrown into the 2005 manual. It babbles on about images being 21.4 MHz away from the real frequency -- true for simpler models, but not so for the PRO-2005.

The audio output quality is good, although the top mounted speaker directs the sound at the ceiling, but adding an external speaker would allow the sound to be directed at the user.

Unfortunately, the audio level of AM signals is somewhat below that of NBFM signals, requiring a different setting of the volume control. When scanning both AM and NBFM modes, one has to find a compromise position of the volume control.

The PRO-2005 squelch control has a wee bit too much hysteresis, a trait inherited from its ancestors. It's like having too much play in a car's steering wheel, or backlash in a gear set. This hysteresis forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. It's not as sloppy as in the early PRO-2004s. I've successfully eliminated this problem completely by replacing a single resistor on the 800XLT, as well as the PRO-2002, PRO-2003, PRO-2004 and PRO-24 scanners.

Mechanical Construction

The PRO-2005 is lighter than the 2004. It is enclosed in a gray plastic cabinet, with a plastic front panel. If one is going to pay $420, one deserves to own some metal, but several stages are internally shielded in their own metal compartments. The entirely plastic cabinet of the older PRO2003 allowed wideband noise to radiate out of the scanner and into nearby shortwave receivers.

The PRO-2005 vertical front panel is an advancement over the sloping panel of the 2004. Now you can stack the scanner on top of other equipment and see the controls without standing up. If sitting directly on a table, two hinged plastic feet, padded with rubber bumpers, can fold out from under the front of the radio to tilt it at a

good viewing angle.

- 6 -

There is a single BNC antenna connector on the rear of the PRO-2005, and a single telescoping antenna is supplied.

Internal construction is excellent, and the internal shielding is commendable. Interstage shielding is very important in a wide band receiver, to prevent it from "hearing itself", an undesirable phenomena which results in birdies. The PRO-2005 owner's manual lists the birdie frequencies. The shielding is much better in the PRO-2005 than in the 800XLT, which uses no shielding around the 800 MHz converter stage, and probably accounts for some of the birdies in the Bearcat.

Frequencies and other indicators are displayed on a back-lit LCD (liquid crystal display) panel, and the level of backlighting can be dimmed by a pushbutton switch.

Vision impaired scanner buffs will appreciate the conventional raised rubber keyboard in the PRO-2005, which replaced the flat membrane keyboard in the PRO-2004. Only moderate pressure is required for actuation, and key depressions are confirmed by a mild "beep" audio tone.

The PRO-2005 is the right size to fit under the dashboard of intermediate sized cars. Although it can be operated on 12 VDC, neither a mobile power cord nor mounting bracket are provided. These items were included with earlier, pre-PRO-2004 Radio Shack models. The AC power cord is not detachable, and would have to be bundled up to keep it out of the way in a mobile installation.

Owner's Manual

The user manual is outstanding compared with the fold out sheet furnished with Uniden scanner.

A single page frequency allocations chart is included, but is not current. There is no schematic. Thankfully, detailed service manuals for Radio Shack scanners are usually available for $7.50 or $10.00.

The PRO-2005 is warranted for 1 year, which is reassuring.

What's Missing?

So with all these neat features, what's missing from the PRO-2005? A "search and store" mode, like that on the

ICOM R7000 and older Bearcat 250 would have been nice. A lighted keyboard and a signal strength meter would also be welcome, as would a mobile mounting bracket and SCA output jack.

Summary

If all one wants is a scanner to monitor local police and fire, there are certainly cheaper and simpler models than the PRO-2005. This scanner is for those who enjoy actively exploring voice communications in the VHF/UHF spectrum. If you already own a PRO-2004 and have added the diode to expand it to 400 channels, there is little to be gained by purchasing a new PRO-2005 -- unless, of course, you are a passionate scanner collector.

The PRO-2005 has the right features and performance, especially for scanning the wide 225-400 MHz military aircraft band. Good design should not to be taken for granted. GRE engineers used the power of the micropro-cessor to implement useful features in the PRO-2005. Similar processing horsepower was not used so wisely in the Yaesu FRG-9600.

At about $420, the PRO-2005 provides a good alternative to those not wishing to spend $1050 for an ICOM R7000.

x
CANADIANS TO BUILD NEW SURVEILLANCE RECEIVER

by Bob Parnass, AJ9S

A communications intercept receiver system monitors a defined frequency range to provide as much information as possible about any signals present. This is accomplished by first doing a spectral search, also known as spectral surveillance. Then the operator can use signal processing equipment to perform a detailed analysis on one or more of the signals found.

The Canadian government has embarked on a project to develop a new wideband surveillance receiver covering the 20 - 1100 MHz range. The system will use a Watkins Johnson WJ8617B receiver and a signal processor (digital quadrature receiver) connected to its 4 MHz wide IF output.

The system will have both coarse and fine search modes of operation. The coarse search mode will use a 4K fast Fourier Transform (FFT) over the entire 4 MHz IF bandwidth, yielding a resolution of 1.5 kHz. The fine search mode will use the FFT over a 200 kHz wide band, permitting 50 Hz resolution.

The engineering work is being done by the Defense Research Establishment Ottawa (DREO).

Information for this note was taken from the March 1988 unclassified report Dynamic Range Considerations in Narrowband and Wideband Superheterodyne Surveillance Receivers, by Andrew Mudry, of the Electronic Warfare Division of the DREO.

> number of state laws which took away this freedom.

I suspect the biggest culprit in ECPA-1986 is cellular phones.
By limiting our rights to listen to the airwaves, they make it illegal
to listen in on cellular phone calls.

Once all the lawyers and politians (who LOVE cellular phones - nice status
symbol) got wind of the fact that cellular phones were actually radio, and that
it is legal to listen in on any radio broadcast, I bet they hurredly rushed
ECPA through. And they had the clout to do it too.

That's my theory anyway. Any facts out there? How close am I to the truth?
Should I have posted this to talk.rumors? Am I asking to many questions?

oops! Here come the scanner police... gotta go. bye.

From: KA1RLX@K1LTJ
To: ALL@ALLBBS

To: All users of MFJ-1278 Multi-Mode TNC

From: KA1RLX @ K1LTJ

Subject: Update to previous bulletins: Scrambled Packets Solved

Date: 89-05-07

In response to numerous requests for an update on the status of the MFJ-1278 TNC's problems with scrambled packets, here is the latest news.

A new ROM has been issued for the MFJ-1278 Multi-Mode TNC which, in addition to adding a few new features, cures all known problems with packet operation. This new ROM has been tested by K1LTJ and myself for the past several months and has performed properly without exhibiting any of the lock-up & scrambled packet problems seen with earlier ROMS.

If you have been experiencing the problems detailed in previous bulletins contact MFJ directly to exchange the ROM in your 1278. Depending on the version you own there may be a small charge for this updated ROM due to the software enhancements included with the bug fixes.

de KA1RLX @ K1LTJ, 73.

858. Re: Need frequency information for microwave transmitter

Newsgroup: rec.ham-radio
Date: 1989-05-12 19:03:21 UTC
From: lkraft@hpccc.HP.COM
Message-ID: <5540024@hpccc.HP.COM>
Source record: 18630

I duplicated one of these gadgets once, many years ago. I don't remember the model, but I was able to measure the transmitting frequency by using a loop of wire connected to a frequency counter. If you select a short gate time you can get enough consistent readings to give a good idea what the frequency is. In fact, the exact frequency didn't appear to be critical; the frequency was determined by a simple LC network which I expect drifted all over the place.

Anyway, it consisted of a single oscillating stage operating at about 300 MHz which was pulse modulated by a PCM encoder. I don't remember the number of bits, but the whole thing easily fit on a small PC board, including a short stub antenna. I just hand copied the PC artwork, produced a PC board, obtained and loaded the parts, and adjusted the length of an air-wound coil to set the frequency. After that, it was fully operational.

Hope this helps.

859. RS-232 to TTL converter for Kenwood Radios

Newsgroup: rec.ham-radio
Date: 1989-05-12 19:04:12 UTC
From: wa2sff@cbnewsh.ATT.COM
Message-ID: <589@cbnewsh.ATT.COM>
Source record: 18631

I have constructed the TTL to RS-232 interface for the Kenwood radios
and now have it working.
Until I get software I am using a terminal emulator to talk to the Kenwood.
I thought others might be interested in the interface.
Any comments would be welcome.

Joe Wilkes
att!hound!wa2sff

The following is a diagram for an RS-232 to TTL converter for use with
the Kenwood series of radios.

I built the interface and have transmitted and received data between
the computer and the TS-140.

Parts list:

1 1488
1 1489
1 7404
1 1K resistor
1 rs232 connector
1 six pin connector for kenwood (radio shack)
1 box
1 power supply with +5v, +12v and -12v.
3 IC sockets
1 perf board
misc. wire, nuts, bolts, washers, bypass capacitors (0.1 ufd)

Notes:
1) I had to invert all TTL signals to make the interface work.
The data with the computer interface for my TS-140 would lead me to
believe that I only had to invert the CTS and RTS leads.
If you have trouble making the interface work correctly try removing
the inverters.

2) An RS-232 break-out box is useful in debugging the interface.

3) Cn means computer interface lead n.

4) Rn means radio interface lead n.

5) Someone told me the Kenwood interface is optically isolated but I
don't hear any more RFI from the computer with the interface connected
than with the interface disconnected.

6) For best results use shielded cables between the computer and the converter box and between the converter box and the rig.

7) Bypass the +5v, -12v, and +12v to ground near each IC.
Typical values are 0.1 ufd or higher capacitor.
Deluxe approach--- 0.1 ufd and 10ufd in parallel.

RADIO-TTL COMPUTER RS-232

1 GND--- GND---1
2 TXD--- TXD---2
3 RXD--- RXD---3
4 CTS--- RTS---4
5 RTS--- CTS---5
6 NC --- +5v--1K res------DSR---6

860. Don't junk that old Bearcat BC-300 scanner

Newsgroup: rec.ham-radio
Date: 1989-05-12 19:09:23 UTC
From: parnass@ihuxz.ATT.COM
Message-ID: <4494@ihuxz.ATT.COM>
Source record: 18632

x
DON'T JUNK THAT OLD BEARCAT BC-300

by Bob Parnass, AJ9S

Although the Bearcat BC-300 scanner is no longer available, it occupies a fond place in my collection. I exercise little self control when I see a used BC-300 for sale cheap, and have adopted two broken units. They make fine radios after repair.

The BC-300 was the forerunner of today's 760XLT. It was a 50 channel feature laden scanner, introduced around 1979, back when Bearcat was part of Electra. Retail sales of the BC-300 continued until 1987, when it was discontinued by Uniden.

Although Electra offered the pricey BC-350 as a step above the BC-300, firmware bugs and a batch of bad power transformers doomed the 350, and the 300 remained the jewel of Bearcat line.

It's easy to see why the BC-300 model was offered for several years. It boasted premium features like a clock, a carrier operated solid state relay for tape recorder activation, a transmission counter, and a Service Search of 11 ROM banks of preprogrammed channels. For memory, the BC-300 used EAROM (electronically alterable read only memory), so backup batteries were not necessary. The Dog House, a radio shop in Fairfax, Virginia, at one time offered the DH 1000, a 1,000 channel adapter for the BC-300! Unfortunately for federal band listeners, the BC-300 lacked coverage of the 138-144 and 406-420 MHz bands.

While outwardly impressive, internal construction was typical of Electra hand wiring in that era -- a bit messy. BC-300 schematics show at least 100 components changed between earliest and later units. The scanner went through many circuit design changes, but rather than changing the printed circuit board, new components were tack soldered on the foil side in different positions.

Electra stamped all of its scanners with a manufacturing date code on the rear of the cabinet. The code is comprised of a single character (C = Cumberland, Indiana, P = Puerto Rico), followed by four digits denoting year

and week the radio was built. For example, "P2284" denotes the radio was made in the Puerto Rico factory during the 22nd week of 1984.

Switching power supply failure was common in early units due to insufficient capacitance. Electra responded by increasing the value of capacitor C98 from 22 ufd/16 v to 47 ufd/25 v, but I recommend 47 ufd/35 v. If your display is getting abnormally dim, C98 is probably the culprit, as it was in five Bearcat scanners I fixed.

Squelch preset potentiometer R81, mounted on the radio circuit board, was misadjusted in new units, requiring readjustment after the components aged.

In one radio, I replaced Q9, a small signal PNP transistor. Its failure caused the BC-300 to become deaf on all but the UHF band. Failure of squelch gate transistor Q15 caused the squelch to remain open at all times.

Cold solder joints, especially on the wires and ribbon cable connecting the radio board to the logic board, have been responsible for other failures.

I have seen serious IC failures in three BC-300s built around 1984. These include CPU chip IC201, memory chip IC202, and IC203, not in stock at your your local Radio ShackO.

The BC-300 circuitry, especially on the radio board, is very similar to the circuitry in the the BC-220, BC-20/20, BC210XL, and BC-350, so some of the previous remarks may be applicable to these models as well.

I can neither furnish schematics nor repair your radio. If you come across a broken BC-300, obtain a schematic from Uniden and spend some time troubleshooting. If you give up, your BC-300 can be fixed by Electronic Repair Centers in Franklin Park, Illinois, (312)455-5105. I'm told they do good work. The BC-300 is a classic scanner and worthy of your efforts.

>time according to the input signal (and whether the person is talking or
>not). Significant bandwidth savings are possible.
>
>An integrated pure-packet-switched voice/data communication system would be
>a noteworthy achievement even outside amateur radio.
>
>Phil

Hmmm, I'm working on building a pine bookcase, and when it's done, I'm
going to build Trump Plaza. Now THAT would be an accomplishment!

But packet voice is one of those neat curiousities whose pitfalls are
deep and many. AT&T in fact just announced what might be the first
real, practical packet (not cell, which already exists, cell meaning
physical layer packet) switch, the IACS. It's full of clever hacks
that you need to make voice sound good on packet, like echo cancellers,
timestamped buildouts, etc. It's aimed at digital terrestrial backbone
nets, which have lots of digital bps bandwidth.

Ham radio, though, deals in an essentially analog medium, radio, and
our limiting commodity is analog bandwidth (spectrum space). So
between Nyquist and Shannon, it's easier to let voice go as voice
(analog) than to first do a Nyquist transformation and then a Shannon
one back to analog!

Then the real zinger. Even with echo cancellers (not needed if you're
half-duplex or not using two-wire telephone sets), you want total
delay in the hundred millisecond or so range. Satellites are annoying
for telephony, even without echo. Now voice needs 32 kbps or so (ADPCM)
or at least 16 kbps for fairly cheap low-quality (ie., ham quality),
so you need to be able to sustain 16 kbps throughput to do packet
voice.

Now Phil, you and I are in another mailing-list discussion about the
desirability of TCP timers, where typical packet radio takes MINUTES
to get a response to a packet. Typical ham packet today is good for
maybe 100 bps, per user. Glenn's high-speed backbone work will enable

us to support decent interactive data applications, but a couple Mbps is a whole lot more efficienty spent on data than on a few packet voice connections!

Not to come off as flaming, but we really do need to increase packet radio bandwidth by a couple orders of magnitude, just for non-voice use; I'm happy to use traditional ham means for voice. Clever technical hackery is fun and may be useful as an experiment, but we're many years away from even thinking about digitizing voice on packet backbones. Heck, when packet radio (other than the TCP/IP work) gets past the mid-1970s, then we'll see where we go next.

Foriegn hams frequently don't have the same bands. There
is usually SSB from Europe in the 21.150 to 21.200 range.
There are also SSB signals from 7000 to 7100. The latter
is more understandable because the European 40M band ends
at 7100.

HR DX BULLETIN 19 ARLD019
FROM ARRL HEADQUARTERS NEWINGTON CT
MAY 12, 1989
RELAYED BY KB8NW/OBS & BARF-80 BBS
TO ALL RADIO AMATEURS BT

THANKS TO WB2CJL AND THE WESTERN NEW YORK DX ASSOCIATION FOR THE FOLLOWING DX INFORMATION.

DXCC DESK. MALAGASY REPUBLIC. DOCUMENTATION FOR THE 5R4VT OPERATION HAS BEEN RECEIVED. DXCC CREDIT FOR THIS OPERATION WILL BEGIN WITH APPLICATIONS RECEIVED ON APRIL 3, 1989 AND AFTER.

WESTERN CAROLINES. JG1RVN WILL BE ACTIVE AS KC6TY FROM THE REPUBLIC OF PALAU MAY 22 THROUGH THE 26TH ON RTTY. FREQUENCIES WILL BE 14090, 21090 AND 28090 KHZ. QSL VIA TORU, JG1RVN.

ROTUMA. 5W1GP, YAMA, WILL BE ACTIVE FROM HERE MAY 13 THROUGH 20. HE WILL ALSO TRY TOKELAU, ZK2YY, MAY 24 FOR THREE DAYS AND AMERICAN SAMOA, KH8AH, MAY 31 THROUGH JUNE 2. ALL QSLS FOR YAMA NOW GO TO JH4IFF. HE WILL BE LEAVING 5W1 IN AUGUST.

VANADA. VK9JS AND KN6J ARE NOW ACTIVE FROM HERE AS T33JS AND T33RA ON SSB, CW AND RTTY. DUE TO DELAYS, THE OPERATION MAY BE CUT SHORT.

GLORIOSO. FR5AI/G WILL BE ACTIVE FOR ONE MONTH BEGINNING MAY 19.

MARION ISLAND. ZS8MI, PETER, IS QUITE ACTIVE, BEING REPORTED ON 28400 KHZ AT 1600Z FOR FOUR HOURS WORKING EUROPE AND NORTH AMERICA, AND ON 14180 KHZ AT 1625Z WORKING NORTH AMERICA BY CALL DISTRICTS.

ST PETER AND PAUL ROCKS. THE DXPEDITION HAS BEEN DELAYED DUE TO BOAT TRANSPORTATION. THEY SHOULD ARRIVE AND BE ACTIVE THIS WEEKEND. THE CALLS WILL BE ZY0CW ON CW, ZY0SY ON RTTY AND ZY0SS ON SSB. QSLS GO TO NATAL DX GROUP, P.O. BOX 597, 59021 NATAL, BRAZIL. THIS IS A NEW ADDRESS.

MOZAMBIQUE. JUNE ACTIVITIES FOR C9MKT HAVE BEEN CANCELED, BUT JACK SAYS THAT HE WILL BE ACTIVE TWICE DURING THE MONTH OF MAY, THE 12TH THROUGH 14TH AND 19TH THROUGH 21ST.

CHAD. F2CW STATES THAT F3CW WILL OPERATE AS TT8CW STARTING MAY 16 FOR UP TO FOUR WEEKS. THIS OPERATION WILL BE ON CW. QSL VIA F2CW.

NEW PREFIX. DURING THE MONTH OF JULY, LIBERIAN AMATEURS WILL SIGN THE PREFIX 6Z IN OBSERVANCE OF THE 142ND INDEPENDENCE ANNIVERSARY OF THE REPUBLIC OF LIBERIA. ALL QSLS FOR 6Z CONTACTS MUST GO VIA K5HUT.

PLEASE DO NOT QSL DIRECT TO LIBERIA.

ANOTHER NEW PREFIX. CYPRIOT AMATEURS ARE SIGNING C4SCG FOLLOWED BY
THEIR REGULAR SUFFIX DURING THE MONTH OF MAY AR

GOOD LUCK ON DX DE KB8NW/OBS

Hmmmm, an interesting hypothesis. I lived in the UK until I was 12 and watched a lot of TV then (B&W 425 line), and have lived in 60Hz "countries" since then (oh all right - 33 years more, I'm 45!). On visiting the UK/Europe I don't see flicker except in special circumstances, bright picture/dark room etc. I certainly have never found it objectionable, yet others on the net have.

Anyone out there grown up with 60Hz and then spend an extended period (say more than 10 years) with 50Hz?

The interesting thing is that I DO see the flicker on high resolution (>1k line) graphics displays with the 60Hz scan rate. Those are fairly rare now since I think a lot of people got headaches etc. from them.

}>books 21.1 thru 21.2 does not have any phone priv. for any class of license.
}>Does anybody know where these signals are comming from ?
}
}Today I heard several SSB phone stations between 21.1 and 21.2 MHz -
}Among them was a British ham (I think) operating just below 21.2 MHz.
}Does anyone know if the band allocations in the UK (or anywhere else,
}for that matter) allow phone operation between those frequencies?

The U.S. is actually an oddity among nations in that we have formally
allocated "sub-bands" for different modes. Most countries (not sure about
the UK) have no restricttion on phone operation other than being within the
ham band. They DO have "gentleman's agreements" between hams which keep
things orderly much like our repeater allocation/coordination.

Even those countries which DO have sub-bands (such as Canada) deliberatly
allocate more space to phone than the US allocation due to the much greater
ham population here. In some cases though the "extra only" assignment (e.g
75 M) is pretty close to their assignment. Just from memory Extras get
3750-4000Khz phone, Canadians get 3725-4000Khz. Enough for a couple of
nets.

On 40M it is even more bizarre since outside North/South America 7200-7300Khz
is non ham! If you listen around 7050-7070 Khz LSB you will hear some
European activity most nights. The problem is filtering out the broadcast
QRM, but thats another story.

>in all that bad taste- at least she was pretty :^)!

This brought to mind an earlier experience of mine. I was thumbing through some old back issues of Byte, to show my girlfriend the "early days" of microcomputers. Sure enough, in the ads in the back pages (yeah, that was the real reason for subscribing to Byte) were some of the "girlie" ads that used to be pretty common in '70s electronics rags.

She couldn't stop laughing at it ("Amp-le Annie? Ha!"), but she also thought that the advertisers were ignoring (or offending, or both) a good portion of the market, using that technique...

Subj: HF PACKET STATIONS STATE SIDE.
Hi, I am new to packet radio but hope to get on air after I get a PK-232 next
month. I want to know if there are packet paths (HF) between the USA and VK
and hence what packet stations are available state side for receiving
HF packet input from where I am living, in Chile.

Where can I get the operating frequencies, times, calls etc of HF packet
stations that can forward to VK. I know of VK2AGE in VK that receives HF packet.

I would appreciate any information

Brian Jarvis VK7XD/CE2

Peter Morgan Lucas asked:

> Does anyone out there actually BUILD gear any more? Almost all the hams i get
> to talk to nowadays can do nothing but quote 'rice box' model numbers at me and
> little else. Do we all have too much money (i certainly dont!!)...
> ......
> Think about it - when did *YOU* last *BUILD* something......

I understand the thrust of your concern, but actually "building
equipment" is only one litmus test for technical ability.

Sure, I build small projects from time to time, like chargers, audio
amplifiers, test equipment gadgets, and even a QRP transmitter or two.
But, I don't build the main components of my station -- and I don't feel
guilty about it. Here's why.

I know basically HOW and WHY the commercial equipment works, and
know enough to fix them when they break, or modify them to suit my
needs. Time is just too precious to spend hunting down parts and doing
the mechanical layout to build a synthesized VHF transceiver or an
HF receiver with the features I want. (My first bitter parts
procurement experience was at age 14, waiting over 6 months
for an XR-50 coil form to build a 6AQ5 based cw transmitter.)

High praise and admiration are due those hams who finish sizeable
construction projects, but I choose to spend my time differently.

Hossein Firooznia writes:

> Today I heard several SSB phone stations between 21.1 and 21.2 MHz -
> Does anyone know if the band allocations in the UK (or anywhere else,
> for that matter) allow phone operation between those frequencies?

In Europe (IARU Region 1), the voice subbands for HF are:

160m 1.840 - 2.000
80m 3.600 - 3.800
40m 7.040 - 7.100
30m no phone
20m 14.101 - 14.350
17m 18.110 - 18.168
15m 21.151 - 21.450
12m 24.930 - 24.990
10m 28.300 - 29.300; 29.550 - 29.700

SpaceNews

MONDAY MAY 15, 1989

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly
on packet radio bulletin board systems and the Unix USENET news network.
It is available around the world on many computer news systems and is available
for unlimited distribution.

* SHUTTLE NEWS *

U.S. Space Shuttle COLUMBIA is being prepared for mission STS-28 at the
Kennedy Space Center, Florida. It is presently located in Orbiter Processing
Facility (OPF) 1, and is expected to remain there until late June, when it
will be transferred to the Vehicle Assembly Building for mating with its
external tank and solid rocket boosters.

* OSCAR-9 NEWS *

Diary software reloads will take place on Tuesdays and following this, a CCD
image will be transmitted. The time the image is taken will depend on earth
illumination. During the Northern hemisphere winter months, this will either
be Tuesday or Wednesday mornings, UTC. The CCD image will be transmitted until
00:00 UTC on Thursday, when the beacon will switch to Digitalker telemetry.

* OSCAR-10 NEWS *

According to Peter, DB2OS, and AO-10 command station VK5AGR, OSCAR-10 is again
available for use from 01May89 until September. Due to eclipse periods, the
transponder will not be available for use between MA 226 and MA 24.
The eclipse period will end on 13Jul89, and the transponder will then be
available for use during the entire orbit. Please discontinue use if "FM-ing"
effects are noted on the beacon or transponder downlink passband.

01May89 to 13Jul89: Mode B : MA 25 to MA 225
OFF : MA 226 to MA 24 (eclipse period)
14Jul89 to Sept 89: Mode B : MA 0 to MA 255

* OSCAR-12 NEWS *

The following operating schedule for FO-12 is expected to remain in effect
until the end of May:

```
Mode : Time Period (UTC)
------+------------------
JD : 21May 0311-1123
JD : 24May 0841-0137 (25May)
JD : 28May 0056-0908

* OSCAR-13 NEWS *
-----------------
The following operating schedule for AO-13 is expected to remain in effect
until 14Jun89 when a spacecraft attitude change will be made:

Mode : Beginning (MA)
------+---------------
B : 003...160
JL : 160...200
B : 200...240
OFF : 240...003
S : 210...222 (Beacon Only 2400.661 MHz)

* MICROSAT NEWS *
-----------------
Here is a list of frequencies that will be used for the following MicroSats:

AMSAT-NA : MicroSat-A (PACSAT-OSCAR-14 after launch):

Downlink : Uplinks

Primary : 437.050 MHz : 145.900, 145.920, 145.940, 145.960 MHz
Secondary : 437.025 MHz

BRAMSAT : MicroSat-B (DOVE-OSCAR-15 after launch):

Downlink

Primary : 145.970 MHz
Secondary : 145.970 MHz

WEBERSAT : MicroSat-C (NUSAT-OSCAR-16 after launch):

Downlink : Uplink

Primary : 437.100 MHz : 145.900 MHz
Secondary : 437.075 MHz

AMSAT-LU : MicroSat-D (LUSAT-OSCAR-17 after launch):

Downlink : Uplinks

Primary : 437.150 MHz : 145.900, 145.880, 145.860, 145.840 MHz
Secondary : 437.125 MHz

WEBERSAT will support a CCD camera experiment, an FSK packet radio receiver,
a voice synthesizer, and a BPSK packet radio transmitter.

BRAMSAT (Digital Orbiting Voice Encoder, or DOVE) will downlink voice messages
and telemetry using digital voice synthesis and 1200 baud AFSK ASCII.
```

PACSAT and LUSAT will both support FSK packet radio receivers, and BPSK packet radio transmitters. No digital repeater operations will be employed to minimize interference among users.

:: SWEDEN CALLING DXERS ::
:: from Radio Sweden ::
:: Number 2041--May 2, 1989 ::
::::::::::::::::::::::::::::::::::

Shortwave and other electronic media news from Radio Sweden.

This week's bulletin was written by Agnes Carbon.

Electronic Edition edited by George Wood.

Packet Radio BID SCDX2041

---------------------------------------------------------------------------

BELGIUM--BRT's Spanish broadcast to Latin America uses now 15515 kHz instead
of 9925 kHz at 20:00-20:25. (Yimber H. Gaviria, Colombia).

COLOMBIA--Updating SCDX-2037, Meridano 70 from Arauca is back on 4925 kHz and
was heard until 03:05. (Keijo Salokangas and Bo-Kristian Lindqvist, both
Finland) Our listeners do not write if they heard earlier Centro Todelar en
Arauca on the same frequency. (DX Editor)

ECUADOR--HCJB has replaced 9720 kHz with 9745 to North America at 00:35-06:30
in English because of jamming. 11775 and 15155 kHz remain in parallel. (Tom
Sundstrom via Compuserve). HCJB will be back at its previous time 20:00-20:30
for the broadcast in Nordic languages on 15270, 17790 and 21470 kHz from May
7th. (Mogens Jensen, Denmark)

WEST GERMANY--Deutsche Welle has added some frequencies to its Spanish
broadcasts to Latin America: 11810 kHz at 02:00-02:50 and 15425 and 17720 kHz
at 23:00-00:50. (Stefan Druschke, West Germany)

GUAM--15225 kHz is now used 20:00-09:00 by KSDA. In parallel 13720 at 10:00,
15310 at 21:00, 15125 at 22:00 and 11980 kHz at 02:00-09:00. (George Jacobs
and Associates via Tom Sundstrom)

INDONESIA--Ujung Pandang seems to use 4719 kHz for its local morning and
evening transmissions at 20:55-00:30 and at 08:55-16:05 which is supposed to
be on 4753 kHz. (Richard E. Wood, USA)
```

IRAN--English to Europe from the Voice of the Islamic Republic of Iran is on 6035 kHz and 9022 kHz at 19:30-20:30. (Jack Kyle, UK)

ITALY--AWR Forli is on the air with a DX program on Sundays in English at 05:30-06:00 and 09:30-10:00. The regular service at 07:00-08:00 and 11:00-12:00 on 7257 kHz. (Joachim Maurer, West Germany). AWR Forli was heard using 7125 kHz until 06:00 which does not appear on its new schedule. (Stefan Druschke, West Germany).

JAPAN--Radio Japan has replaced 15195 with 17880 kHz at 01:00. (Tom Sundstrom)

NORWAY--From May 7th, the duration of all Norwegian broadcasts from RNI will be reduced from 45 minutes to 30. Up to three separate programm will be broadcast on different frequencies simultaneously dependent on the local time in the target area of each frequency. Half-hour programs in English will continue to be broadcast on Sundays only but on fewer frequencies to enable broadcasts in Norwegian to be carried at the same time. According to the schedule the five minute Monday programmes in Spanish will be temporarily suspended due to budgetary problems. (BBC Monitoring)

PAKISTAN--The Radio Pakistan frequencies in use at 16:00 including slow-speed news in English at 16:15 are to the Middle East on 21740, 21580, 17660 and 15605; and to South and East Africa on 21480 and 11895 kHz. (Tom Sundstrom)

PHILIPPINES--Radio Veritas has announced the introduction of shortwave broadcasts to Siberia in May. The 250-kW shortwave transmitter built in 1986 for broadcasts to Korea, China, Vietnam and Burma will be used for these new broadcasts. (BBC Monitoring)

PORTUGAL--Radio Portugal's current schedule in English is: 03:30 on 6060 and 9680 kHz to North America (East), 03:30 on 9705 kHz to North America (West), 16:00 on 11870 and 15250 kHz and 20:00 on 11740 kHz to Europe. (Tom Sundstrom)

SPAIN - RNE in Spanish to Latin America is now on 17715 kHz at 22:05-22:55 (replacing 11775 kHz). (Joachim Maurer, West Germany)

SURINAM-Radio Surinam International was heard back on 17875 kHz at 17:00-17:50 with news in English at 17:35 via Radiobras. There is strong interference from Deutsche Welle in German on this frequency. (Joachim Maurer, West Germany)

TAIWAN--Updating SCDX-2C38, the Voice of Free China broadcasts in German to Europe at 20:57-21:57 on 11860 kHz (and not 11850 kHz). French is at 19:57-20:57 on the same frequencies (17845, 15440, 11860, 9785 and 9765 kHz). (Uwe Gruner, West Germany).

UNITED KINGDOM--The Great North Radio in Newcastle started broadcasting on MW on April 8th. The programs consist mainly of pop music and are on 1152 and 1170 kHz. (John Coxon, England)

USA--WHRI has been heard in Portuguese until 22:00, followed by English on 13760 khz with 17830 kHz in parallel. WRNO which is scheduled to use 13760 kHz

at 21:00 (see SCDX-2011) remains instead on the frequency it uses at 17:00-21:00: 15420 kHz. (Joachim Maurer, West Germany).

WYFR, Family Radio, will be broadcasting from May 7th on 15345 kHz from 16:00 in English, 17:00 in German and 18:00 in Italian to Europe. (Auvo Liimakka, West Germany)

WCSN is on 9840 kHz at 06:00-08:00 and on 21780 kHz at 14:00-16:00. (Richard E. Wood, USA). WHRI is on 7365 kHz at 02:00-06:00 with 9495 kHz in parallel. The latter frequency replaces 11790 at 14:00-15:00 with 15105 in parallel. WSHB is on 7405 at 00:00-02:00 with 13760 kHz in parallel, adding 17855 kHz at 08:00-10:00 to 9455 kHz. 9465 kHz replaces 15205 khz at 22:00-00:00. (Tom Sundstrom)

USSR--Radio Kiev uses 9860 kHz in English to North America at 23:30-00:00. (Jack Kyle, UK)

JAMMING--Jamming has reappeared on 6005 kHz disturbing RIAS Berlin in German. (Slawomir Mierzejewski, Poland)

Sweden Calling DXers is the world's oldest radio program for shortwave listeners. Radio Sweden has presented this round-up of radio news, features, and interviews on Tuesdays since 1948. RS broadcasts to North America:

15:30 hrs on 17880 and 21610 kHz
03:00 hrs on 9695 and 11705 kHz

To Europe, Africa, and the Middle East:

17:00 hrs on 1179, 6065, and 9615 kHz
21:00 hrs on 1179, 9655 and 11705 kHz

And to Asia and the Pacific:

12:30 hrs on 17705 and 21610 kHz
14:00 hrs on 17705 and 21610 kHz
15:30 hrs on 17705 kHz
01:00 hrs on 15390 and 17790 kHz

The Radio Sweden schedule to Europe can be found on Sky Channel's teletext Service, Sky Text, on page 496.

The Electronic Edition is based on the Sweden Calling DXers bulletins which are mailed out every 4 weeks to contributors. Contributions can be sent to DX Editor George Wood to Swedish telex 11738, CompuServe (via the HamNet Forum or Easyplex 70247,3516), through the FidoNet system to 2:501/297 or to SM0IIN at the packet radio BBS SK0TM.

Reports can also be sent to:

Radio Sweden
S-105 10 Stockholm
Sweden

Contributions should be NEWS about electronic media--from shortwave to satellites--and not loggings of information already available from sources such as the "World Radio TV Handbook". Clubs and DX publications may reprint material as long as Sweden Calling DXers and the original contributor are acknowledged, with the exception of items from BBC Monitoring, which are copyright.

We welcome comments and suggestions about the electronic edition, Sweden Calling DXers, and our programs in general.

Thanks to 44 contributors this week Good listening!

Shortwave and other electronic media news from Radio Sweden.

This week's bulletin was written by Agnes Carbon.

Electronic Edition edited by George Wood.

Packet Radio BID SCDX2042

---------------------------------------------------------------------------

AUSTRIA--Radio Austria International broadcasts in Spanish at 02:30-03:00 on
9870, 9875 and 13730 kHz; at 06:30-07:00 on 6115, 9870, 13730, 15410 and
21490 kHz; at 13:30-14:00 on 6155, 13730, 15450 and 21490 kHz, at 20:30-21:00
on 5945, 6155, 9870 and 13730 kHz; and at 22:30-23:00 on 6155, 9870 and 11780
kHz (Juan Franco Crespo, Spain)

CANADA--Updating SCDX-2037, Radio Canada International is broadcasting now in
English and French to the Middle East at 03:00-04:00 on 11730 kHz and at
04:00-05:00 on 15275 kHz, probably relayed by Radio Austria International.
(David Crystal, Israel)

Radio Canada International's new schedule in French is weekdays at
05:00-05:15 and 05:30-05:45 on 6050, 6140, 7295 and 9750 kHz; 19:00-19:30 on
5995, 7235, 11945, 15325, 17875 kHz; and 20:30-21:00 on 5995, 7235, 9670,
11945, 15325, 17820 and 17875 kHz. Weekends at 18:30-19:30 on 7235, 15325,
17875 and 21675 kHz.

CUBA--Radio Havana Cuba introduced some changes in its Spanish schedule from
May 1. The station now broadcasts at 00:00 on 9770 kHz; at 06:30-07:30 on
15230 kHz; at 09:00-11:00 on 6060, 11760, 11815, 15155, 15300, 15340 and
17750 kHz; at 18:00-20:00 on 11755, 15350 and 17850 kHz, at 20:00-22:00 on
15155 and 15300 kHz; at 23:00-01:40 on 11910 kHz; at 23:00-02:00 on 11760
kHz; and at 23:00-06:00 on 6060, 11725, 11800 and 11970 kHz. (Juan Franco
Crespo)

CZECHOSLOVAKIA--Radio Prague has added two new frequencies to its French
broadcast to Africa at 18:30: 13215 and 11910 kHz. 7205, 9600, 11685 and
```

11990 kHz remain in parallel. (Francois Chalory, France).

FRANCE--Radio France International broadcasts in Spanish to Spain at 21:00-22:00 in on 945 and 5995 kHz. The DX program is aired in the second half hour of the broadcast on Mondays and Tuesdays. (Juan Franco Crespo)

GREECE--Updating SCDX-2033, the Voice of Greece broadcast at 15:00-15:50 has moved from 17580 to 17550 kHz. (Ciro Caportorto, Italy).

INDIA--Some All India Radio regional stations have changed their shortwave frequencies. AIR Calcutta is on 7210 kHz at 06:30-10:00. Air Kurseaong is on 7230 kHz at the same time and Air Ranchi is on 7215 kHz at 07:00-09:40. (Dr. Supranik Sanati, India)

IRAQ--English from Radio Baghdad is to Europe at 20:00-22:00 on 9770 kHz, to North and South America at 01:30-03:30 on 9515 kHz and to India and Pakistan at 01:30-03:30 on 11800 kHz. (Kanwarjit Sandhu, India).

ISRAEL--On April 23rd, Kol Israel's DX Corner announced the following changes in its English language schedule, effective from April 30 to September 3rd. 04:00-04:15 on 17575, 15640 and 11585 kHz to North America, 17630 to Australia/ Asia, 11655 to Eastern Europe. 10:00-10:30 on 21760, 17578 and 11585 kHz to Western Europe, 15650 to Australia/Asia and 17590 to Eastern Europe. 17:00- 17:15 on 11585 kHz to Western Europe, 11655 to Eastern Europe. 19:00-19:30 on 17630, 15640 and 11605 kHz to Western Europe/North America, 17630 to Africa, 13750 to Eastern Europe. 21:30-22:00 on 17630, 17575, 15640 and 11605 kHz to North America/Western Europe, 17575 and 15640 kHz to Latin America and 13750 kHz to Eastern Europe. 23:00-23:30/00:00-00:30/01:00-01:30 to North America on 15640, 15615 and 13750 kHz. (Tom Sundstrom via Compuserve).

Kol Israel broadcasts now only in Spanish and no longer in Ladino at 02:30-02:55 on 11605, 12077 and 15615 kHz and at 23:30-23:55 on 15165, 15640 and 17575 kHz. Listeners are asked to show interest by sending reception reports in order to prevent suspension of these programs due to budgetary problems. (Juan Franco Crespo)

Kol Israel is in Portuguese at 01:30-01:55 on 17575, 15460 and 15615 kHz (Yimber H. Gaviria, Colombia).

ITALY--Adventist World Radio in Forli is in Spanish on Wednesdays, Thursdays and Fridays at 05:00-05:30 and 09:00-09:30 on 7257 kHz and no longer on Mondays and Tuesdays. (Juan Franco Crespo)

JAPAN--Radio Japan is in Spanish to Latin America at 03:30-04:00 on 15325 and 15350 kHz via French Guyana, 11870, 17825 and 21610 kHz, at 09:30-10:00 on 11875 and 21635 kHz via Gabon. (Juan Franco Crespo)

German broadcasts are now on 21690 kHz via Gabon at 06:00 and 21500 kHz directly from Japan. At 20:00-20:30, Radio Japan uses 11835 kHz. (Alfred Dastig, West Germany)

KAMPUCHEA--A station was heard on 6972/75 kHz from 18:00-18:55 in a local language and is believed to be an external service to Europe from Kampuchea

via a Vietnamese transmitter. (Joachim Maurer, West Germany).

MONACO--Trans World Radio broadcasts in Spanish on 9495 kHz on Sundays and Tuesdays at 12:00-12:15 and on 1467 kHz on Thursdays at 19:15-19:30 on Tuesdays, Wednesdays and Thursdays at 20:30-20:45. (Juan Franco Crespo)

NETHERLANDS--Radio Netherlands has replaced 21615 kHz with 21520 for its English broadcast at 11:00 to South Asia. (Mrs Clare Pinder, UK)

Here are some changes in the Radio Netherlands Spanish schedule: at 02:30-03:25 on 6020, 9590 (6165 and 15560 kHz via Bonaire); at 04:30-05:25 on 6165, 9590 kHz (via Bonaire); at 11:30-11:55 on 6020, 11660 kHz (via Bonaire); at 11:30-12:25 on 15560 kHz; at 12:00-12:25 on 9775, 15530 kHz (via Bonaire); at 18:30-19:25 on 9855 kHz; at 20:30-21:25 on 6020 kHz; at 22:30-23:25 on 9895, 15150, 17575 kHz, and at 23:30-00:25 on 11715, 15315 kHz (via Bonaire). (Juan Franco Crespo)

NIGERIA--Updating SCDX-2037, Radio Nigeria closed on April 25th. According to this report, "following 6 years of missed schedules and transmitting faults due to ancient equipment and financial constrictions, the Federal Radio Corporation of Nigeria can no longer sanction Radio Nigeria operations". (G. Williams, UK) We assume this means the external service, the Voice of Nigeria, which was long regularly heard in Europe on 15120 kHz.

On the other hand, the Organization of African Unity intends to start a radio station which would be called the Voice of Africa. There's speculation it will be headquartered either in the Nigerian Acapital Lagos or the Egyptian capital Cairo. (BBC Monitoring)

Sweden Calling DXers is the world's oldest radio program for shortwave listeners. Radio Sweden has presented this round-up of radio news, features, and interviews on Tuesdays since 1948. RS broadcasts to North America:

15:30 hrs on 17880 and 21610 kHz
03:00 hrs on 9695 and 11705 kHz

To Europe, Africa, and the Middle East:

17:00 hrs on 1179, 6065, and 9615 kHz
21:00 hrs on 1179, 9655 and 11705 kHz

And to Asia and the Pacific:

12:30 hrs on 17705 and 21610 kHz
14:00 hrs on 17705 and 21610 kHz
15:30 hrs on 17705 kHz
01:00 hrs on 15390 and 17790 kHz

The Radio Sweden schedule to Europe can be found on Sky Channel's teletext Service, Sky Text, on page 496.

The Electronic Edition is based on the Sweden Calling DXers bulletins which are mailed out every 4 weeks to contributors. Contributions can be sent

to DX Editor George Wood to Swedish telex 11738, CompuServe (via the HamNet Forum or Easyplex 70247,3516), through the FidoNet system to 2:501/297 or to SM0IIN at the packet radio BBS SK0TM.

Reports can also be sent to:

Radio Sweden
S-105 10 Stockholm
Sweden

Contributions should be NEWS about electronic media--from shortwave to satellites--and not loggings of information already available from sources such as the "World Radio TV Handbook". Clubs and DX publications may reprint material as long as Sweden Calling DXers and the original contributor are acknowledged, with the exception of items from BBC Monitoring, which are copyright.

We welcome comments and suggestions about the electronic edition, Sweden Calling DXers, and our programs in general.

Thanks to 33 contributors this week Good listening!

875. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1989-05-14 02:02:19 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <8905140701.AA23695@ucbvax.Berkeley.EDU>
Source record: 18652

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

ARRL NATIONAL CONVENTION

HR AMSAT NEWS SERVICE BULLETIN 133.01 FROM AMSAT HQ
SILVER SPRING, MD MAY 13, 1989
TO ALL RADIO AMATEURS BT

AMSAT-NA To Operate a "All-Satellite, All-Mode" OSCAR Station

In celebration of the 75th anniversary of the founding of the American Radio Relay League, there will be a commemorative station operation under the callsign of W1AW/5 on 2-4 June, 1989. This activity will take place at the ARRL National Convention in Arlington, Texas. The hours of operation will be from 17:00 UTC on Friday, 2 June, through 18:00 UTC on Sunday, 4 June. In keeping with the convention theme "FROM SPARK...1914-1989...TO SPACE," a "deluxe" satellite station will be set up. It is the intention of station planners to operate this station on every pass of every Amateur Radio Satellite that comes within view of Arlington, Texas, during the operating period. In the case of the UOSATS, demonstrations of bulletin and telemetry capture are planned. All modes of operations will be supported from Mode A, B, J, and L.

Both AO-13 and AO-10 should be usable that weekend along with RS-10/11, FO-12, UO-9, and UO-11. Crank up your tracking programs and check your windows "of mutual visability" to Arlington, Texas, (between Fort Worth, and Dallas) for 2-4 June,1989.

Icom, Tandy, Telex-Hy Gain, KC Tracker, and other manufacturers are providing support for this event. The ARRL is providing special QSLs for this event featuring the "Spark...To Space" logo. Every amateur satellite station in the country should have one of these exceptional QSLs.

AMSAT-NA will be well represented in other ways at this convention. Forums on Microsats and Phase IV will be presented on Saturday by Doug Loughmiller, KO5I, President of AMSAT NA and Dick Janssen, WD4FAB, respectively. On Sunday, Keith Berglund, WB5ZDP, will present an introductory level satellite forum.

If you are coming to the convention, please come by the AMSAT Booth or the Commemorative station to volunteer your operating assistance for

the Commemorative Station. If you would like to volunteer in advance, please contact Keith Pugh, W5IU, at (817) 292-5633.

Last but not least. A full size model of the AMSAT-NA PHASE IV project will be on display in the convention lobby for all interested parties to see. It will be hard to miss since it is approximently 8 ft. in diameter and was constructed by students from the Center of Aerospace Technology (CAST) from Weber State College in Ogden, UT. "See you on any of the birds during the weekend of 2-4 June, 1989."

HR AMSAT NEWS SERVICE BULLETIN 133.02 FROM AMSAT HQ
SILVER SPRING, MD MAY 13, 1989
TO ALL RADIO AMATEURS BT

All Amateurs Are Invited for a "Beginners" Seminar On OSCAR Basics

Bob Dalleske (W6AMW), AMSAT-NA Area Coordinator, is pleased to announce that an all day seminar about OSCAR satellites is being planned for the northern California area known as "Shasta SpaceCon '89." This seminar will take place at the Student Center at the College of the Siskiyous located in Weed, CA. According to Bob, this seminar is being designed for amateurs, who at the present time, have only a "casual interest" in OSCAR satellite communications and would like to learn more about this exciting aspect of amateur radio. Bob has lined-up an impressive group of speakers which include: Ross Forbes (WB6GFJ), President of Project OSCAR, Courtney Duncan (N5BF), AMSAT-NA VP of Operations, Cliff Buttschardt (W6HDO), Frank Dziurda (K7SFN), Bob Lahde (NA6E), Steve Roberts (N4RVE), and Ed Westbrook (WA6IUM). These experienced satellite users will be "gearing" their forums to folks who want to know what it takes to to get on the AO-13. They will cover such topics as "What are Amateur Satellites and what does the future hold," "MICROSATs: The new 'bird' on the block," "A beginners guide to AO-13," and many, many more topics ranging from equipment needed to get started, and problems which beginners usually encounter getting started. Bob stresses that "technical-jargon" will be kept to a minimum because this conference is designed to inform all those who are not necessarily versed in the technical aspects of satellite communic-ations -- in short, you don't have to be a aerospace engineer or RF communications "type" to find this seminar useful. For more information about this excellent beginners conference, contact Bob Dalleske, W6AMW, at (916) 964-3154 or send a s.a.s.e to

Many AO-13 users are unaware that there is an AMSAT Operations Net
which is conducted on AO-13 several times each month to help answer
questions about OSCAR satellites and to provide information about the
many exciting things going on in AMSAT. The following is a list of the
times for the Ops Net. Please place this list in a convenient place in
your OSCAR station so that you won't miss out on this interesting net
which is offered as a service to all AMSAT members.

Here is the Ops Net schedule through May:

Date UTC orb-phs NCS

14 May 0400 702-056 N5BF (13 May local time, U.S.)
21 May 0200 716-188 (20 May local)
28 May 0200 731-105 (27 May local)

The following is the operating schedule for FO-12 for the entire month
of May and June:

DATE MODE OPERATING PERIOD
05/21/89 JD 03:11 UTC until 11:23 UTC
05/24/89 JD 08:41 UTC until 01:37 UTC on 05/25/89

05/28/89 JD 00:56 UTC until 09:08 UTC
06/03/89 JD 05:46 UTC until 00:44 UTC on 06/04/89
06/09/89 JA 04:25 UTC until 21:20 UTC
06/21/89 JA 01:43 UTC until 18:38 UTC
06/24/89 JA 01:03 UTC until 17:58 UTC
06/29/89 JA 00:35 UTC until 15:29 UTC

As a reminder to those who made contacts with the Mir Space Station and would like to obtain a QSL card confirming the contact, you can send your card to the the following QSL Bureau for U1MIR, U2MIR,...,U5MIR:

Boris Stepanov, UW3AX
P.O. Box 679
Moscow, 107207 USSR

>
(small flame on)

Well gawdam maude, this here guy says I'm an appliance operator because I talk on a rice burner occasionally. Wonder if I'm still an appliance operator when I use my store-bought service monitor or computer? After all, I remember back in the "good old days" when men were men and radios had tubes and computers had front panels.

>Think about it - when did *YOU* last *BUILD* something......
>Hands up anyone who hasnt got

Well I don't use a soldering iron much anymore. CAD, fast turnaround PCB houses, circuit simulation, and surface mount technology have pretty much relegated the old soldering iron to the shelf - except for soldering on PL-259's for the 'ole rice burner. I am kinda cozy with my hot air station though.

>
>Even if its only building a simple direct conversion receiver for 20

>ham movement as a whole.

These lines are getting kinda old. Tell me, what does building a simplton receiver from an article in a magazine have to do with our missions? You remember, advancing the state of the art, etc. Sure there are old farts around that waste bandwidth and oxygen but so what. Instead of bitching, how 'bout doing something constructive. After all, you don't need anybody's permission to design something.

Yes, I talk on rice-boxes. I understand my capabilities and what I can and cannot do. I realize that the engineers at the factory R&D labs can almost always design better radios than I and most other hams could. If for no other reason than they have the necessary equipment and I don't. It's long since past the time when a knight-kit oscillator and a light bulb dummy load were all that was needed to build a state-of-the-art radio.

One last comment - I consider those who build organizations; ie, the politicians, to be at least as important as the hardware hackers. Most of our common modes of communications - repeaters, packet, ATV and so on REQUIRE cooperation among hams and interfaces with outside concerns. Whether it's obtaining a mountaintop radio site for my latest digital thingamajig or setting up a 501(c)(3) corporation in order to get needed equipment donated by corporate donors, it all counts.
>
(small flame off)

So I'm sitting around the shack looking at things. Over in the corner I see the 25 watt synthesized porta-pak type 2 meter radio I designed and built a few years ago. Over there is a crude spectrum analyzer built around an old heath scope. Over on the bench is a high speed driver board for packet that I never got around to cleaning up and publishing. I see on the packet monitor a binary file being forwarded thru the BBS system using my Chunk'n'Glue program (software's as important as hardware these days, you know). I'm listing to the CD player on a stereo amplifier I designed and built while in school. Over on the other side of the shop is the Tesla coil I built using a 4cx250 as a power oscillator. Will work again too, as soon as I replace the screen bypass caps that detonated from over-current. Then there's the single-chip micro controlled nicad battery quick charger that charges my HT and cellular phone batteries in under 30 minutes - at the same time too. No, it doesn't work on 20 meters but it does it's job well.

On the bench right now is an adaptor to let me use a laptop PC as a smart bullet chronograph - which fits into my other hobby - long range marksmanship. And I'm resurecting a project put on the shelf a few years ago that used radar to track a bullet's speed throughout its flight. Makes the ballistic calculations much more accurate.

Then I notice some paperwork I need to work through for the local packet organization. Politics, you know. Hard to erect switch sites in thin air. And when I go back to work monday as a software engineering manager, I'll probably spend lunch with a collegue who just passed his novice test and is waiting for his call. In order to help repair the mental damage done by learning CW, he's working on a pretty nifty application to ride on top of phil karn's tcp/ip system. I'm providing some design and coding assistance and helping with ham things he may not yet understand.
>
Oh yeah, before I forget, I'm not particularly affluent. And I have an agreement with my wife that my hobbies have to be financed outside my salary. So what do I do? Well, I buy and sell equipment, do some

consulting and a bit of refrigeration work on the side. In short, I find a way to support my hobbies at a comfortable level. This whining about money I hear from so many hams these days makes me sick. It's so trivially simple to make hobby money these days that there is no excuse for whining. With lawn services charging 50 or 60 bux to cut a quarter acre lot and handymen being a dying breed, if you can walk and chew gum at the same time, you can make money. I know a couple of people my age (mid 30's) who make spending money mowing lawns. Couple-three hundred dollars a week after work. And you don't need to make megabucks. 500 to a thousand dollars will buy a nice rig (or a nice scope :-)

I hate to sound like Wayne Green on this subject but he's absolutely correct in his arguments that equipment cost is a lame excuse for not doing things. All you gotta do is get off your arse and do it!

Subj: stabalised power supplies

Is anybody aware of a source for stabalised power supplies. I am
interested in something in the range of 500W to 1000W with
outlets for 115V AND 220V (or 240V).

Thanks for any information that you can give me.

From: JARVIS AT DGAESO51
To: EARN::"info-hams@simtel20.army.mil"
Subj: HF forwarding packet stations in USA
Hi, I am new to packet radio but hope to get on air after I get a PK-232 next
month. I want to know if there are packet paths (HF) between the USA and VK
and hence what packet stations are available state side for receiving
HF packet input from where I am living, in Chile.

Where can I get the operating frequencies, times, calls etc of HF packet
stations that can forward to VK. I know of VK2AGE in VK that receives HF packet.

I would appreciate any information

Brian Jarvis VK7XD/CE2

>Eric Jacquier

I can't comment on the other receivers you mention, but the Sony ICF-2010's performance is outstanding for reception of international shortwave AM broadcast stations. You can tune in a station that is heterodyning with an adjacent station and contains a lot of phase distortion, then enable the synchronous detector, and it is instantly intelligible and the beat note disappears. There is absoultly no question that this feature alone distinguishes this receiver from its peers which lack it.

If you are planing on purchasing a receiver for AM listing, make sure it has a synchronous detector.

Things do look kind of hopeful from the report of that meeting.

I bet there are a lot of comments that were filed with the FCC on 87-14
that were totally ignored. That's not what the process is supposed to
be about. One issue I raised in my original comment was that the FCC staff
had establish the idea/concept/precedent of letting the Inland Waterways
system on 216-220 Mhz get developed since it had only been recently set up.
I point out that this precedent should also be applied to the even newer
Novice Enhancements, mentioning that more than just Novices will be using
that band as a result. The report and order never touched the subject.
I don't know if they ignored my comments, but they certainly ignored the
topic.

Also, why can't UPS use 855 Mhz just like IBM CE's do with their little
"brick" computer-radios? They work just fine inside the machine room here
and run all day off a tiny (not bigger than 4 AA's) nicad battery, so they
can't be putting out that much power. They also have no visible antenna.
UPS's situation couldn't be much worse.

883. ICOM IC-2GAT Antenna Questions

Newsgroup: rec.ham-radio
Date: 1989-05-15 15:03:06 UTC
From: mmullica@SADIS01.AF.MIL
Message-ID: <8905161632.AA22222@sadis01.af.mil>
Source record: 18657

ATTENTION ICOM HT OWNERS (especially the IC-2GAT):

I own an ICOM IC-2GAT (and just love it, thank you) and do a fair amount of business traveling, generally staying in hotels along the way. I always take my trusty HT and Repeater Directory with me and when time permits, try to check-in to the local 2-M repeater seen. My HT with its "rubber duck" puts out a signal that when radiated from the confines of the typical iron re-bar reinforced concrete structures (often in excess of 6" thick) of most "modern" hotels is whimpy at best. Even though I am sometimes many stories high, the structure of the building when coupled with the HT-class power (generally 5 watts or so) and the "duck" antenna really limit my transmitting capability.

I recently bought a Larsen self-resonant 1/2 wave antenna with a 39" (or so) piece of flexible "aircraft cable" for a radiating element (instead of the traditional whip). The antenna terminates into a standard 50 ohm co-ax connector. Because I can roll this self-resonant 1/2 wave antenna up and stow it in my briefcase (in a physical space about the size of my fist) and connect it to my HT's BNC via 15' or so of co-ax, the intent here was to make this my "traveling 2-M base station antenna" and hook/tape it to my hotel room's exterior window. I expect this should improve my transmit capability by at least a factor of 2.

In discussing my plans with some of the local crew, one of our ICOM gurus tells me that the ICOM HTs resonate their "duckies" at 30 ohms and not 50 ohms like the KENWOOD or Yeasu rigs and that the above mentioned solution might produce an SWR situation bad enough to damage the HT's finals. But another of our local antenna/feed line gurus tells me that if I connect the 50 ohm antenna to a feedline greater than 2 wave length long (15' or so should do the trick), I should be OK.

MY QUESTIONS:

Can anyone confirm/refute the alleged 30 ohm antenna impedance of ICOM HT's?

Has anyone had any good/bad experiences driving 50 ohm antennas with their ICOM HTs?

Does anyone have any other nifty 2-M HT oriented highly portable self-resonant "base station" antenna solutions (e.g., for hotel use) that have proven effective (am especially interested in solutions involving ICOM HTs)?

884. Antenna coupler unsatisfactory

Newsgroup: rec.ham-radio
Date: 1989-05-15 15:14:00 UTC
From: commgrp@silver.bacs.indiana.edu
Message-ID: <12600060@silver>
Source record: 18660

Along with my PRO-2004 scanner I bought an Antenna Specialists (tm)
"All Band Scanner Antenna Coupler" ($20) which allows scanner and
AM/FM car radio to simultaneously share the broadcast antenna.

The coupler is a block of black plastic with no adjustments. The cable
to the scanner originally had a "Motorola" plug, which I replaced with
a BNC, shortening the cable 1/2 inch in the process.

The coupler is satisfactory as a scanner antenna on VHF and UHF;
AM broadcast performance is good but FM broadcast attenuation is
UNACCEPTABLE (on a typical Japanese digital-tuned car radio).

FM-broadcast performance is too poor to receive stations 40 miles
away, and becomes much worse during the following PRO-2004 conditions:

scanner turned off
scanner on an unused frequency (0.00 MHz)
scanner tuned above 760 MHz

The PRO-2004's input impedance apparently changes during the above
conditions, affecting the antenna coupler (although the coupler works
normally with the scanner disconnected). Setting the scanner's
attenuator switch to the -10dB position alleviates the additional FM-
broadcast loss.

Conclusion: Don't buy this coupler if you listen to out-of-town FM
broadcast stations.

>Does anyone out there actually BUILD gear any more?

Perhaps. I think there're still folks who enjoy construction projects, but they're in the minority. Some of the motivation is gone. I thought that new gear was expensive. But then I looked in a 1960 Radio Amateur's handbook, at the prices in the back. Adjust for inflation, and for lack of features and *WOW*! This was one expesive hobby back then! No wonder people home-brewed!

Then I went to a flea market. Saw a good HW101 for $150. Saw TR3/RV3 for $225. A Tempo One for same. So the motivations aren't there any more.

The part of homebrewing I enjoy is getting simple gear working. I don't think that that many SSB exciters have ever been home-brewed, in spite of the dream projects you see in QST. It's always been very expensive to buy all the components at retail, if you can even get them.

Is that done? Seriously?? If it's like you say, it's REALLY bad
since time-adjacent lines are from the same field and therefore
actually separated by one line in the frame. How does one build a
delay of 1H that's stable to a few degrees of 3.579MHz? I think I
see how this would work, but it seems like a really dumb way to do
things: low performance and not particularly cheap. (but I suppose
I'm missing something again -- thanks in advance for setting me
straight :-)

(It does seem clear to me that this technique and its attendant loss
of resolution is not dictated by NTSC!)

That model was reviewed just last month by Larry Magne on Radio Canada Int'l's SWL Digest program, and he panned it pretty thoroughly. It is just an old-style multiband portable radio, with no real redeeming features. The shortwave coverage is broad, but there is no bandspread, so each SW broadcast band occupies a tiny slice of the dial. There is no digital readout, so tuning a particular frequency is just about impossible, and returning to a specific frequency once tuned is a matter of chance. There is backlash in the dial mechanism, so a slight touch of the tuning knob can move the tuned frequency a variable and indeterminate amount, not necessarily in the direction you intended to tune! The circuitry is of an old and obsolete design, giving rise to many images and spurious signals, with poor selectivity so you cannot separate closely-spaced stations.

It is just about impossible to compare this with a really usable radio, like the Sony 2001 -- by the way, when you cite that model, do you mean the currently-marketed radio sold with that model number outside the US, called the "2010" inside the US? (It would be "2001D"; Sony is insane when it comes to assigning radio model designations.) There WAS a previous "Sony 2001" (I have one); it was the first of the all-digital portable SW radios, and is still usable. It had a few problems (mechanical breakdown of the keys and keypad, and poor selectivity) but still is a reasonably-useful radio.

Don't waste money on the Venturer. It would be worth buying for a few bucks at a yard sale, but otherwise should be avoided. You can get a decent digital-readout radio, like a Philips/Maganavox D2935, or Sangean ATS-803, for under $200. The extra cost is well worth it if you really wanted to listen to shortwave. Both of those are digital-readout models, so shortwave stations are easy to tune, are stable and perform reasonably well -- they are probably the best value-for-money on the market today.

Regards, Will Martin

People still build, it's just that the components have gotten more complex. In the old, old days, you had to have a vacuum pump and a glass works, then tubes became components that were purchased and combined into more complex functions.

Combining a >= 4800 baud modem with a modern "rice box" is no less challenging than building a super-regen from a 12AU7, and it's much more useful!

C'mon, guys! It's a big hobby! Those who enjoy the "cutting edge" aspect of it will prefer not to re-invent wheels, but will combine larger and larger chunks of off-the-shelf fuctionality in new and exciting ways. Those who enjoy craftsmanship and the very act of building something will continue to spend more time and effort on re-creating existing technology than if they had purchased it -- so what? Those who simply enjoy a good chat are going to do it by the most cost-effective means, which is *not* by building it -- who cares?

"Real hams" make their own ICs from beach sand! :-)

A monthly forum for ideas about packet traffic handling
Jay Farlow, WB9MDS, Editor

AMTOR-PACKET LINKING PROGRAM TO ADD NTS FEATURES
By Bob Foster, WB7QWG @ WB7QWG

APlink is a bulletin board program which acts as a gateway between AMTOR
and packet radio (see IPNN 11/89). Vic Poor, W5SMM wrote the program. An HF
traffic handler has requested Vic install special handling for NTS traffic.
So Vic has developed a scheme to handle that request. He has only received
input from that one individual, and is seeking other opinions.
The following information comes from an excerpt of planned APlink
documentation.
The purpose of APlink's NTS features would be to make selected APlink
installations a clearing point for NTS traffic being passed between active
NTS stations. When activated, these facilities would restrict access for
certain NTS traffic to designated NTS stations and provide for automatic
confirmation of access and forwarding back to originating stations. The
APlink SYSOP would be expected to coordinate with NTS Trans-Continental Corps
(TCC) directors, to learn what stations should be allowed NTS privileges.
The proposed software would have specific requirements of operators who
enter NTS traffic. If they expect the designated NTS stations to handle the
traffic it would have to be addressed to the call sign of the APlink station,
or the "@ BBS" field would have to be left blank. For example, where WA8DRZ
is the APIINK station, any of the following commands would "capture" a
message for the NTS user:

ST WA8DRZ
ST NTS
ST WA8DRZ AT WA8DRZ
ST NTS AT WA8DRZ
ST WA8DRZ AT 94062
ST NTSTX AT WA8DRZ

In other words, any "ST" message reaching WA8DRZ with WA8DRZ in either
the "TO" field or the "@ BBS" field or with a blank "@ BBS" field is
considered an NTS message with restricted access and to be cleared by a
participating NTS station.
Continuing with this example, messages arriving at WA8DRZ, that are
addressed such as the following would be autoforwarded by the APLINK station
and would not be treated as restricted NTS messages:
```

ST 78240 AT NTSTX
ST WB7QWG AT WB7QWG
ST WA5QZI AT 78229

ANY station would be allowed to ENTER an NTS message. Restrictions would only apply to message ACCESS.
Messages intended to restricted NTS access would have to use the following form (lower case is the APLINK system response):

ST WA8DRZ
nr 5678 nts ga msg + ?
NTS WISCONSIN

NR 45 R HXG W7ABC 8 TACOMA WASH 1254Z 23 MAY

ROSEY MAY JONES
321 GARDEN ST
GREEN BAY WISCONSIN
404-555-4321

HAPPY BIRTHDAY X SEE YOU SOON X LOVE
TONY

NNNN
nr 5678 filed ga + ?

Note that the "title" or "subject" line is the NTS routing. The first non-blank line following is the standard NTS header.
When a station with NTS privileges enters the command, "NTS," APlink would send a list of all NTS messages that have not been accepted by an NTS station. If the station then reads any of the messages, APlink would send the following prompt:

ACCEPT (YES / NO / CANCEL) + ?

The system would not proceed until one of the three responses is given. A response of YES means that the NTS station accepts responsibility for further delivery and APLINK will mark it as forwarded and delete it from the NTS message list. A response of NO leaves the status of the message unchanged and a response of CANCEL provides the option of removing a message from the system that is unsuitable for amateur handling. In all three cases APlink would generate a confirmation message as discussed below.
The confirmation message would be addressed to the station originating the message into the APLINK system (not the station whose call appears in the NTS header line).
The confirmation will take the following form:

CNF

UR MSG NR 5678 ACCEPTED BY W2DEF 890523/1534Z
NR 45 R HXG W7ABC 8 TACOMA WASH 1245Z 23 MAY

NNNN

The word "ACCEPTED" will alternately be "READ" or "CANCELED" depending on the accessing station's response to the above prompt.
APLINK would hold messages in the system for at least 24 hours after they have been marked as forwarded. Sometime after 24 hours has passed from forwarding, APLINK would remove the messages from the system and archive them. Only the SYSOP could retrieve a message from the archive. A message that remains unforwarded in the system for 21 days would be removed and archived.
Please send comments on these proposed features to WB7QWG @ WB7QWG. If you wish, also send a copy to WB9MDS @ KB8NH, for possible inclusion in a future issue of IPNN.

Source record: 18662

(Putting on Long Grey Beard..)
Back in the "Good Olde Days", when hams were hams, etc., and really built things, the things they really built weren't very complex. The things I built back in the 40s and 50s (mostly), couldn't have had more that three dozen parts for the most complex (plus screws, nuts, etc.). I suppose that I built more than many did. Certainly only the most ambitious have built receivers since some time in the 1930s. Vhf converters were common projects up to the 60s, but only took a couple of dozen parts. Most xmtr building went out when SSB came in ....

I don't count kit assembly as "building", since no design effort or thought is involved.

Why this comment? Well, with the proliferation of advanced semiconductor complex components, a MUCH wider range of things can be built within the "three dozen parts" limit. Think about what is possible. Since digital design is MUCH simpler than RF analog, or at least cantains much less "art", digital projects with perhaps twice the parts count seem reasonable. Certainly a very simple binary-phase-shift-keyed adaptor for use with SSB transceivers could be done in less than 50 parts. As mentioned by Glenn Elmore and others, "brick" power amplifiers, etc., greatly reduce the effort required to get repectable power at VHF and higher.

My main point is, using maximum-scale-of-integration greatly leverages the effort spent on home building projects, where design-time and skill is often the limiting factor. Let the (JA) manufacturers use a thousand parts in a rig, maybe that approach is cheapest for them - where reproduction cost predominates. When I set out to build but one device, I need to get the maximum from the limited time I have available - thus buy subassemblies where possible.

Comments? (ie: what about software/firmware complexity? off-the-shelf utility modules?)

Bob, W3OTC

896. DUAL-BAND HT FEEDBACK

Newsgroup: rec.ham-radio
Date: 1989-05-16 13:08:55 UTC
From: mmullica@SADIS01.AF.MIL
Message-ID: <8905171438.AA27595@sadis01.af.mil>
Source record: 18666

RE: DUAL-BAND HT FEEDBACK

Earlier this month, I asked the INFO-HAMS "world" a question pertaining to dual-band HTs. I got such a good response to my inquiry, I thought I'd share a few of my my "answers" back with the INFO-HAMS group. Hopefully, this feedback will be of benefit to someone.

My initial inquiry went as follows:

ATTN: DUAL-BAND HT OWNERS!

I'm in the market for a dual-band HT and want to know if any of y'all have had any experience, good or bad, that I may profit from?

I'm leaning toward the YAESU FT-470 because of its price, size, memory management features and autopatch auto-dialer. Also looking at ICOM's IC-32AT and the new KENWOOD TH-75A. The FT-470 is the least expensive of the three (I found a source that quoted me $479). I've always been an ICOM-man in the past, but I have an open mind.

Candid owner/operator comments are what I'm looking for. If you had it to do all over again...which rig (if any at all) would you go with? Any regrets in going dual-band on a HT platform? Etc., etc., etc.

With the price of these rig's being what they are, I need to do it right the first time!

THANKS!

Martin Mullican, KB5JDQ

Here are some of the responses I got from you, the INFO-HAMS folks.

Martin,

I purchased the Icom IC-32AT at Dayton Hamfest. I had looked at and talked to the owners of all the dual band talkies. When I started looking I had a strong bias towards the Icom because of the accessories that I already had. At Dayton I saw the Yaesu 470 and several hams that I know bought them outright. After playing with one for a while I almost went inside and bought one but then I stopped and talked to the fellow that is at most of the major hamfests who does all the mods to the radios. When I found out all the things that he could make the 32AT do I decided to go ahead and get one and also protect my investment in Icom accessories. One of the mods that he makes converts the 32AT into a cross band repeater without any external hardware. I bought it from Universal Amateur Radio in Reynoldsberg Ohio for $499. I did buy the Yaesu 4700 mobile dual band

radio though.

Randy Jarrett WA4MEI

Martin:

I have owned a Yaesu FT-727R for about a year now and love it. However, it is nothing compared to the new 470.

The dual band HT is great and I don't think I would sacrifice it for anything else. Even though you lose some of the convenience of a small package that is available in some of the mini-HT single band rigs, the performance that most dual bands offer is much superior.

I am trying to sell my 727 so that I can move up to the 470 quite soon. One of my close friends bought the 470 in Dayton and he loves it. It has more features on it that all of his other equipment combined! Five or six of the other guys in my repeater group have ordered or are planning on ordering one within the next few months.

On the other hand, one of our group bought the Icom 32AT and is very happy with it, although it doesn't have as many bells and whistles.

Getting off the subject, would you know of any of the crews from your base coming up to the London International Airshow on June 3 & 4. We are setting up a special events station and would like to get this out to a few of the crews to see if we can get some good contacts. Any help would be appreciated!

Hope this info is of some help.

73 de VE3ZDC...Dave Colvin
Univ. Western Ontario, London, Ont., Canada

Martin:

I own a ICOM 32AT .. and could not be happier with it. This HT has given me no trouble at and has EVERY feature you could possibly want. This bulletin board has had some horror stories lately about the Yaesu HT, and has for the brand new Kenwood HT .. I would wait a year before buying it. I know that the 32AT is a little pricy ... but believe me ... it is well worth it.

Fred J. Stellabotte - N2JCD

Martin,

If you've "always been an Icom man", you'll find the IC-32AT satisfying, and will continually wonder upon hearing all the HT-of-the-week weenies talking about the more-memory, more-features Yaesu and Kenwood handhelds whether you've done the right thing after all. Until you start dropping the set off tables, onto driveways, and the like. Now, I'm told that the small-format Kenwoods withstand similar abuse well in their own right, although those I've seen that have been the unplanned objects of such "testing" do end up a bit more scarred >from the experience than the Icoms (an ABS vs. Icom's polycarbonate case would seem to be the reason). As an Icom man, you already have a complement of

accessories, all of which will work with the '32 (obviously excluding the DC adaptor for the older 10.8v models); get another manufacturer's HT, and welcome to the land of extras all over again (and if you thought Icom accessory prices were a bitch, add another five or ten percent and you've got Kenwood prices).

I got my '32 in February and as you can guess, am pleased with it. I have noticed that the receiver appears to be a tad less sensitive than the '02 on 2m and my Yaesu FT-708R's on 70cm, and (corroborating someone's recent posting on rec.ham-radio) the s-meter is stupidly over-scaled ("s9" readings with the squelch not set high but still closed are irksomely common). The dual-band antenna (like all dual-band HT antennae I've ever seen) is the weak link in the tumbling-drop scenario, and with any dual-band HT, should probably be considered a consumable item, hi. The available soft case isn't quite as nice as the older soft cases with their fabric seam-reinforcements, both in terms of looks and utility (I ceased dicking with the top flap that's a separate piece on the new case and which opens rearward, in fact must be opened to get to the keypad; I have thrown it into the junk box after finding that even after mods with an x-acto knife, it still is a nuisance). Icom decided to use up their inventory of belt clips left over from the micro-nAT line by incorporating them into the '32's design, and these are a minor liability in that under the wrong circumstances, they can bend open if the rig snags on something while still mounted on your belt (and the snag-likelihood is enhanced by the clip's design's causing the radio to ride 1/4" to 1/2" lower on your hip). I've noticed that if you are feeding DC station power to the rig into the top jack, if that power is interrupted (e.g., by jiggling the plug), the set is prone to lose information that you've stored in memory (not a problem if you are careful never to insert/remove the plug unless the set is switched off first, and I've not yet had any problems from mobile vibration with the power plug; I encountered the memory-loss-from-power-glitch phenomenon when heavy-handing the plug in the shack only).

Not being constrained by a choice of obsolete microprocessor technology in the design (as the later '02AT et al were), Icom has been able to update the control software while maintaining the good parts of its old look-and-feel. You'll find operation of the set will come to you quite naturally if you've been using '0n series sets. The three jacks on the top panel are now mounted in a rubber block that provides a nice extra cushion against physical shock (the mic jack on my '02 worked loose and now keying through it is intermittent; I don't anticipate ever having this kind of problem occur with the '32). The rubber caps for the jacks are now captive instead of eminently loseable; only the BNC cap is detachable, and the BNC is now recessed into the top plate, so this one is less likely to go flying away when you detach from things in a rushed situation. Battery consumption seems to be on a par with my '02AT (I use BP-8 or CM-8 packs almost exclusively). One odd observation is that when the battery is low, it will die on 2m transmissions (and the display will flash when the transmitter is keyed) but will continue to transmit on 70cm for a good while longer (on 70cm, when the transmitter is keyed, the "TX" led will light and immediately go out instead of staying lit, and full power seems to be developed anyway, until the battery really is down). The '32 receive audio is louder than the '0n's, which is a mixed blessing in light of the dirty squelch tail (no dirtier than the older Icoms, just more obtrusive now when making use

of the capability to turn it up louder).

I hope this top-of-the-head user report proves useful to you. Let's hear what you ultimately decide to get. Good luck!

73 de KB6OWB!
Harris

Martin,

I have been the somewhat satisfied owner of a Yaesu FT-470 for 3 weeks now. Their are a few things wrong with the rig that I flat out believe are due to dumb engineering. The radio *IS* a pretty nifty rig on the whole, however.

First off, the few things mentioned on INFO-HAMS have been checked out by me, KB7Z, and N7CTM. We all possess 470's. My rig and KB7Z'z are consecutive serial numbers 90243 and 90244. Having a rig out of the first thousand can have it's drawbacks.

The problem about the 17.3 MHz IF is indeed true. Our local NOAA weather station is on 162.475. I took my FT-23 and dialed up 145.175 (in the band plan allocated to linear translator outputs, none in this area) and sure enough when I keyed the transmitter, NOAA popped out on the FT-470. It could be a big problem for people in Cincinnati... Better engineering could have prevented that problem.

The second OH FU I have found is annoying because it's a goof that I feel only a novice or an engineer with a deadline would make. If the radio is *NOT* receiving a signal on *EITHER* band, the speaker is totally silent. No problem. Just what you'd expect. If you are monitoring both bands with one band inactive and the other band receiving a nearly full-quieting to full-quiet signal, you can hear the unsquelched inactive band audio about 20 to 30 db down under the audio from the active receiver. I think any sane engineer would have designed the radio such that an inactive receiver would have it's audio completely muted going into the audio mixer. If you are outside or in a car, it isn't really noticeable unless you are listening explicitly for it. Indoors in a reasonably quiet room, you can't really avoid hearing it. Some people think the received signal isn't full quieting. I haven't been out to the shop yet, but one of these days when I am, I'm going to hook it up to the communications monitor and measure the level of the squelch noise and write YAESU a nasty-gram. Actually, I'm told that Yaesu knows about some of problems and is going to do some corrective engineering. It wouldn't hurt to call them (1-213-404-2700 or I think 1-800-999-2070) and mention the problems and see what you can find out. Maybe they'll get enough abuse that they *WILL* fix them.

On the other hand, the features designed into this rig make it very desireable. Since we don't have local repeater outputs screwing around with local WX stations in the receiver front ends, the first problem *isn't*. I live with the squelch mute problem by baising the balance control toward the primary band which helps. The new Kenwood HT has only two channels on

each band that carry "odd" splits. All others have to conform to band plan. :-(= It only has 20 memories per band, as I recall. The Yaesu has 21 memories/band *ALL* of which can be programmed for any split. The "standard" split selected is changeable. The offset is also changeable. It will store ten 15-digit phone numbers in the autodial memories. The frequency increment in VFO mode is programable as well.

Where I work, we hold a license in the Experimental Radio Service for about a dozen frequencies between 152.0 and 159. MHz. The license limits us to a power level of which I can't recall (25 watts?) and has a waiver on the type acceptance requirements. The only requirement is that its up to *US* to correct any interference problems that we cause. We build and use a lot of little 1 watt transmitters to remotely acquire data in the field for our research. Hence, I am awaiting the Technical Manual (supposed to be available in June) to see if (1) it can be modified for out-of-band transmission and (2) it will cross-band repeat.

In closing, I must say I really have no regrets that I purchased the FT-470. I have already found it very convenient vs packing around either my FTH-2005, FT-23R, or FT-73R. KB7Z has a Kenwood UHF handheld (I can't recall the model. He preferred it to the FT-73R, but now carries his FT-470 around. He also has and likes his Kenwood 721 Dual Band rig, so he isn't really biased one way or the other unlike me. I'm an old Icom man, too (IC-230, IC-22A, IC-2AT).

Since I'm starting to ramble I'll close this out. Hope you find this of some use.
73,
Reid

Martin,

I have the ICOM, and would do it again. The Yaesu and Kenwoods aren't up to the Icom in quality. The Yaesu is very attractive, I'll admit. I've never owned any other units, so this isn't worth a lot.

Martin:

I too have just went through the dual-band HT study. I was serious about the YAESU FT-470, but after talking to several people who are strong YAESU fans, I had second thoughts.

They always seem to have one problem after another. You will also notice a lot of notes bandwidth concerning image problems that this new model has.

Many of the local ARES and CAP groups use ICOM and swear by it. I was convinced, and bought the ICOM 32AT and LOVE IT!!

Jeff, WO0J

In closing, let me say THANKS for all your help folks!

73,

Martin Mullican, KB5JDQ
Kelly AFB MARS

Source record: 18673

In article <5720042@hplsla.HP.COM> tomb@hplsla.HP.COM (Tom Bruhns) writes:
>>...
There are possibly two delay lines in the luminance channel, one
of which is used for chrominance/luminance separation (so-called "comb"
color separation) and one of which is used for delay equalisation. The
first delay line is a 1-H delay.

Since comb separation requires averaging adjacent lines, this
most assuredly causes a loss in vertical resolution.
>>----------
>Is that done? Seriously?? If it's like you say, it's REALLY bad
since time-adjacent lines are from the same field and therefore
actually separated by one line in the frame. How does one build a
delay of 1H that's stable to a few degrees of 3.579MHz? I think I
see how this would work, but it seems like a really dumb way to do
things: low performance and not particularly cheap. (but I suppose
I'm missing something again -- thanks in advance for setting me
straight :-)
>
>(It does seem clear to me that this technique and its attendant loss
>of resolution is not dictated by NTSC!)
>

1-H line combs are built to only average the higher frequency portions
of the television lines, where the color subcarrier is found. The
lower frequencies are not averaged, so there is no loss of vertical
resolution except in the high freq region. The high freq vertical
smear is not that obvious appearing. (A lot of TV signal processing is
designed by making tradeoffs by using processes that make for losses
that the human eye is less sensitive to). One method of building a 1-H
delay line is to make an analog CCD or digital FIFO that grabs discrete
samples of the TV line. The timing of the FIFO is controlled by a PLL
oscillator locked onto the color burst signal. NTSC tv lines are
specified to be exactly 455/2 cycles of the color burst freq, so we can
use a FIFO that is 910 samples long and run it at 4x color burst freq,
to make a 1-H delay. This makes the delay line as stable as you can
make the PLL.

898. Homebrewing for the technically inept

Newsgroup: rec.ham-radio
Date: 1989-05-16 14:28:36 UTC
From: SKOHC@CUNYVM.CUNY.EDU
Message-ID: <8905170704.AA11811@ucbvax.Berkeley.EDU>
Source record: 18667

In reference to the latest round of Homebrewing gear postings I pose the following query:

How can a 22 year old ham, like myself, who is not an EE (electrical Engineering) or other technically oriented major, be expected to build led readout, super-hi-tech, dual-band.... equipment?

Now, I see I might have misled the reader into thinking I'm protesting the Homebrew push. Au contrair, the homebrew power supply and antenna (2 or the many projects that work) have given me immense pleasure - even though its not 12 mhz. digital.....

My point is this: Lets figure out a way of bringing back the know-how and incentive to the ham community, so that everyone can experience the fun of homebrewing.

BTW, I do, of course, acknowledge that there are a great deal of you out there who are quite gifted and knowledgeable in the area of building gear - this posting is on behalf of those who aren't.

As far as learning the code, I don't think it will be a problem. I was a junior in EE and in about 4 study sessions of 2 hrs. each, I learned the code. I would just provide tapes and let them go at it. Perhaps you could suggest/ organize code parties at a local establishment of their choice. Or your house. That could be fun, they would learn the code, and it's always great to do something with a prof. outside of class.

Hi... This is my first post to this group, but I've been reading news and the digest version for quite some time. I've got a few questions for anybody out there with some experience with amateur-related information available via the Internet/Anonymous FTP or otherwise.

So, does anyone know of any subscription lists or Anonymous FTP sites where I can obtain the electronic editions of any of these: the W5YI report, the ARRL Letter, etc.?

The reason I'm interested in this is because I'm the co-editor of the Livonia Amateur Radio Club newsletter, and we're always looking for good articles. In the past, I've retrieved some of these publications from Compu$erve, but that costs big $$$. I figure with net access, I can do it for a lot cheaper.

Please reply via MAIL, I'll post a summary if there's interest.

Any information will be GREATLY appreciated.

901. Re:TM-721-A UHF GENERAL COVERAGE MODIFICATIONS

Newsgroup: rec.ham-radio
Date: 1989-05-16 22:06:52 UTC
From: dea@drutx.ATT.COM
Message-ID: <11245@drutx.ATT.COM>
Source record: 18674

First off, I want to thank Fred Lloyd, KJ6RK, for the excellent information that he gave us on modifying the TM721-A for UHF "General Coverage" . If you have made the mods though, you have no doubt found out that the receiver just can't seem to work much above 455.650 Mhz.

Not being terribly familiar with Phase Locked Loops, I feel like its out of my league to chase this one too far. But for those who are knowledgable (sp?) about those things, here is what I found. I took a Cushman FM signal generator and started walking up the band in 25 khz steps, setting the Cushman first and then tuning the 721. At 455.650 Mhz the receiver would no longer solidly receive the signal, but instead it would slowly oscillate at about a 2 cps rate between white noise and a solid full-quieting signal. My guess between playing with the radio and talking to Fred Lloyd is that the PLL circuitry is simply at the upper limit of its range. Unfortunately, almost all of the local police frequencies that I want to listen to are in the 460-462 Mhz range.

I want to point out that when the receiver was tuned to 455.625 the PLL was working normally and I was able to receive a full quieting signal with a .5 microvolt signal, so we know that the problem isn't sensitivity. I suspect that there is a way to drag the VCO voltage "UP" so that you could use the "General Coverage" spectrum at the expense of the lower part of the amateur spectrum.

At this point I'm going to throw the challenge back out there to you wizzards that eat and breath this digital/analog stuff to try and figure out what kind of alternatives are available to squeeze a little more out of the radios' UHF spectrum.

902. 6MJ6/6LQ6/6JE6C 1 KW HF Amp ?

Newsgroup: rec.ham-radio
Date: 1989-05-16 22:48:05 UTC
From: perry@hpfcdc.HP.COM
Message-ID: <7880047@hpfcdc.HP.COM>
Source record: 18675

Ok, I'm publicly admitting that I ACTUALLY KNOW ABOUT VACUUM TUBES and that I ACTUALLY USE THE HF BANDS. Go ahead and flame me, I love mail.

I rediscovered vacuum tubes after my curiousity took me into the realm of "macho" HF transmitters where transistors are still too expensive for the interesting power levels (What I really want is to get my signal 3 dB over the noise on 80 and 40.) I may even move into VHF after I get HF figured out.

Are there any schematics out there for a 1KW HF amplifier that uses the 6MJ6 sweep tube ? I'm having a little trouble designing a plate tank for these beasties, due to the huge inter-electrode capacitances generated by 4 or 10 6MJ6s in parallel. The TUNE and LOAD values are radically different than say, a vanilla amp using a 3-500Z at 3 KV, which makes finding components quite difficult.

I need at least one of three things:

1) I understand there is an Ameritron HF 1KW amp that uses 4? 6MJ6 tubes. If you have one of these, I'll send you a SASE for a schematic, a dime for the copier, and an "attaboy" certificate not-quite-suitable for framing.

2) I've been told that there may be a 6MJ6 linear amp schematic in one of the old ARRL Handbooks. If you've got one, the SASE offer still applies.

3) The manufacturer's specs for the 6MJ6. There seems to be a serious lack of these, at least for the mfgr (Sylvania) that has their name printed on the tubes I have. I've been guessing Cplate = 23pF, Vp(max) = 1000V, and Pdiss = 30W, which are radically wrong. The full specs would be welcome. An error of a few pF multiplied by 4 or 10 is the difference between something that works and something that gets unsoldered. Again, the SASE offer applies.

The 6MJ6 has several aliases. It also answers to 6JE6C and 6LQ6, so that complicates things a little.

Thanks to all for helping me reduce my spurious emissions. The Rube Goldberg amp I've got is permanently QRT until I design a tank that actually gets a plate current dip.

For those of you interested in the sci.commtech call for discussion:
an update. All the feedback has been positive, and much of it has
been enthusiastic. The idea is to bring together various professional
backgrounds to a common interest: new communication technologies and
their impacts on society, media industries, organizations, and individuals.
The latest developments in technology would also be posted and discussed.
The difference between sci.commtech and, for example, rec.video or rec.audio,
is that sci.commtech will *not* be the place to post inquiries as to what
equipment one might wish to buy.

There has been some discussion about the name, with sci.comm.tech being
a common suggestion; Usenet authorities tell me sci.commtech is better
as the former implies a second heirarchy. Another good suggestion is
to call the group sci.infotech. Please post your reactions to news.groups,
and watch for a call for a vote in the next couple of weeks.

Thanks for your interest, and those who have an opinion which has not
yet been expressed, I encourage you to post as soon as possible.

Thanks.

I stand corrected! Those clever French -- how was I to know that their state of the art in TV would advance an order of magnitude faster than their telephones? ;-)

Hi folks,

After years of inactivity I've finally gotten another
shortwave receiver. I'm at a total loss, however, on where I go
to find general info on schedules of the major international
broadcasters. I know there are clubs out there, but I have no
clue whatsoever on where I would find them. I would really love
to get some info on a couple of SWL clubs to get me started, as
well as the address of the National Radio Club (for MW DXing).

Please respond via email, we don't get any rec.* groups.

73s,
Steve, KA8CMY

What raw materials do you use for building your gear? Do you buy
bulk silicon for building your integrated circuits, or do you refine
the sand yourself? I trust you are not buying pre-made components,
since you feel so strongly about the matter.

I just use a different scale of components than you do. I build things.
I build *systems*.

SUBJECT: Band-plans

Recent discussion on people 'Hearing SSB in the CW section' of 21MHz etc -
just to clarify the situation here in the UK (and i beleive most of Europe
too!).
UK licences are of 2 classes - 'A' (26dBw transmit power, all modes, all
bands, 12WPM code requirement) and class 'B' (26DbW transmit power, all modes,
all bands from 6 metres upwards, no-code).
The band-plan in the UK is *VOLUNTARY* hence you can transmit anything
you like in terms of modes, anywhere you like in the bands for which you
have permission (but you wont make many friends). There are no compulsory
CW or SSB 'segments' as in the States.
Hence if you hear something that doesnt fit with your national band plan,
just remember that there are other countries which dont subscribe to the
same architecture as yours! In practice, it all seems to work OK, until
you get odd band conditions. For example when theres a lift on 2 meters,
everyone goes mad in Europe, and the normal SSB calling frequency (144.300)
turns into a wall of white noise. Problem is, everyone thinks that you must
call on the calling frequency. This is fine when activity is low (when i am
in the far reaches of Scotland, i can beam south and hear *NOTHING* on the
calling frequency for DAYS on end!!!!) but during openings, the only sane
thing to do is to find an apparently unoccupied frequency, and then call.
Then, at least you stand a chance with relatively low power (100 watts PEP
to a 9-ele beam) whereas on the calling frequency you are mixing it
with the big boys (400 watts to 4*9-element beams at 150 feet) and you dont
stand a chance!

ALSO remember that some of the bands in the States are different in the
rest of the world - for example we have '80 metres' 3.5 to 3.8MHz
whereas in the States you call it '75 metres' 3.5 to 4.0MHz. Calling for
Europeans in the 3.8 to 4.0MHz band is likely to be met with deadly silence
(or at best, the BBC World Service - these frequencies are used as a
shortwave broadcast band !!!!!)

Those of you interested in the discussion on building electronic gizmos might find this book interesting: SILICONNECTIONS by Forrest Mims. I found it at the local library and read it a few weeks ago. Copyright date is around '86 or '87, I think. Mims is one of the people who designed circuits, wrote a lot of the project-construction articles for Popular Electronics, and had a column there. He was involved with the MITS organization, wrote the manual for the Altair microcomputer, and his name probably is familiar to anyone who was into electronics as a hobby in the past decades.

Anyway, his comments on the way the hobbyist-electronics magazines changed over the years, and particularily how the project-construction emphasis changed, would be interesting to anyone who cares about home-building electronics. Probably would be worthwhile checking your local library for that book next time you're there...

Here is a MINIPROP (TM) run on the path from California HC8.
It confirms my intuition - almost any time of day or night should
work on 20 and 15 meters.

To help you interpret these results...
The numbers given under each frequency are the absolute signal levels
(based on some reference power and antenna). Obviously, the higher
the number, the stronger the signal. The letter "A" after the number means
that the frequency is above the E-layer cutoff freqeuncy (ECOF) and below
the Maximum Usable Frequency (MUF). This is optimum !
The letter "a" after the number means that the frequency is below the
ECOF - probably lots of absorption (i.e. the signal levels may be overly
optimistic). The letter "B" after the number means that the frequency
is greater than the MUF, but less than the Highest Possible Frequency (HPF).
The band may be open, but don't count on it.

In conclusion, look for the highest signal levels, with the letter "A"
following the signal level. Plan your schedule accordingly.

By the way, MINIPROP (TM) is available from W6EL.

Good luck !

This morning in QST I saw a review of a PLL frequency synthesizer module with lots of control capability. It occurred to me that if one were to find an old Ten Tec Triton, or some such, and remove the VFO, replacing it with such an animal, one might just be onto something...

Let's see, and add a microprocessor controller for some of the other functions...

Hmm.

I agree. In the community I am in I find a lot of people that are not technically inclined in HAM-Radio. They ask a lot of questions about how to build this or that, or how to modify this or that. I usually give them enough advice to work on it, or direct them to suitable literature (both the ARRL Handbook and ARRL Antenna Handbook are excellent reading material for technically disadvantaged persons as a guide to building projects initially). The problem is (just like my kid was afraid of the joystick on the computer to play games) is the fear of the unknown. I know for sure my community could be a better place if more prospective builder and experimenters existed.

I can relay to all that are still afraid (and I'm sure there are not many that are that are on the computer network :-) that there is a great joy in building (and matching) a simple 5/8 wave antenna (and other projects). Nothing feels better when you dig yourself into a hole too deep (technically speaking) and manage to crawl out with a working project. But I preach to the converted here ...

What we need are more `teachers' to give the technically disadvantaged a chance to feel the accomplishment, providing project ideas and giving them an opportunity (if not for a brief moment) to be called an expoit in their field!!!!

As a person who overlaps both in age and inclination the two points of view
mentioned here I have given in to my urge to comment. As a teenager with
little money in the '60s I constructed such things as an amplifier with 2
807's for my even then obsolete 10B ssb Exciter--I know I should have built
the 10B, but I got it for 40 bucks. When 741 op amps came to the boonies
I made things like active filters, etc. Now, it appears to me that state
of the art or even "trailing edge" technology often requires some software
as well as hardware knowledge or, particularly as in the case of UHF, is often
best performed by assembling prebuilt modules in innovative ways. I have
found that many hams are very allergic to software or even "firmware". It's
not that hard to make an EPROM programmer or even to figure out how to use
that technology to advantage. And by software, I don't mean BASIC on Aunt
Minnie's PC. I think ARRL and QST have been particularly slow to under-
stand this. We need projects using digital signal processors (and, damn
it, not just the hardware part and "send $45 and a blank EPROM to W99xxx")
QEX could be filling part of that role, but it's mighty thin. This is the
reason I think the KA9Q software package is so important. This shows that
a group of hams, or even one hams, can understand the interface between
"hardware" and "software" and ultimately marry the two and improve them
both. To me, this aspect is MUCH more important than whether packet radio
adopts tcp/ip or some other protocol for rational networks. There appear
to be relatively few hams who understand this, and half of them are out for
financial gain. I even get a little upset that satellite tracking programs
are sold by AMSAT or that TAPR is (or was) in the hardware sales business.
They are good organizations, but this sort of thing has inhibited the free
true public domain improvement in some areas. Lets somehow update the ham
tradition of using the tools available to solve specific important problems
(whether those tools be soldering irons or cross assemblers).

I am trying to get some information on radio clocks, specifically
the kind used to provide a reliable standard time for a LAN. I have been
recommended to Precision Standard Time Inc. in Fremont, CA. They make a
dandy clock called the Time Source, which is perfect for my needs.
It's a radio receiver tuned to WWV in CO, which puts out serial data
on an RS232 port. This data, as you might've guessed, is the decoded
time according to the NBS.

Now here's the rub:

It seems that PSTI has disconnected their phones. Unfortunately, I
don't know if they have simply moved, or if they are out of business.
This, as you might imagine, makes it difficult for me to order
equipment.

Does anyone out there in netland have any information on PSTI or their
distributors? If they have indeed gone belly up, does anyone have
information on other vendors of similar products? Please forward this
on to anyone with knowledge.

Thanks in advance,

mark roman

Source record: 18682

I use a Yaesu FT-411 (2m) and a Kenwood TH-315A (220). My impression is that these are a good deal like the FT-470 and TH-75A respectively. My opinion is that Yaesu wins hands down on the features, but that Kenwood walks away on performance.

The 50 memories in the 411 mean you can program in every frequency you ever use, even those you only use on trips. The DTMF memories are great for repeater control sequences. The worst feature of the 411 (and the 470 is just the same) is the *extremely* low volume. This radio is *not* useable outdoors unless you use a lapel speaker or earphone. The 411 also suffers from desense and cross-mod in RF-hot locations. It seems to me that there is some synthesizer LO noise apparent in the receiver audio.

I miss a number of the 411 CPU's features in the Kenwood. However, there is plenty of audio, and I have seen no indications of front end overload. My impression is the the 315 is somewhat more sensitive than the the 411, but I have not measured this. The Kenwood gives enough warning of dying nicads to finish a QSO, while the Yaesu just quits. Note that although the TH-75A looks like the TH-2/315, it uses smaller TH-25AT batteries, changers, etc -- that's a drawback if you have 2/315 accessories already. Both the 315 and 411 have gotten compliments on excellent TX audio quality.

A fix for the 411/470 low audio is available from Engineering Consulting in Brea for $23 (714-671-2009 or see any of the ham mags). This is a relatively clean mod, but not for the faint of heart - t'aint much room inside there. See the June issue of 73 for a review of the 411.

I'm waiting for the TH-75A to show up in local stores. I want one.

For me it's still Amateur _EXPERIMENTAL_ Radio, and these days T.V. too!
Sure, I buy to save the chore of re-inventing the wheel, but then I fix the
rice-box or whatever so it has the features I really want, which the
manufacturer forgot to put in.

Most of my time I spend building stuff that you just can't buy - like
microprocessor controlled 2kW 1200MHz ATV repeaters, and multiplexed
digital audio link systems.

I don't have much interest in rubber-stamp "QSO'S" on long waves, and
probably most other constructors don't either, so it's not surprising that
you don't get to talk to many. Now if you call me on 10.150GHz .....

Gotta go - the iron's hot .....

(personal opinion on)

Take a look at the inside of the "new rigs". 'Think you could fix it if
something stopped working? Fat chance! You are dependant upon the
dealers and manufacturers to do the job. 'Probably need computer diagnostics
also plus documentation.

The "old fart" rigs are simple, easier to repair, more-forgiving to
lousy antenna matches, and generally have more power output. You can
get them with the necessary items (dual VFOs, etc). You can also build or
buy a simple digital frequency readout for under $100. if you wish.

And... spend less than 1/2 the bucks.

My old "toober" still gets 200 watts out, has the original tubes, and has
a ton of hours on it (Swan 350C, 19 years old).

Yeah, the new rigs are fun. You almost always need more power with them
and... How many people have you heard on the bands saying: "my ricebox
has (static) something wrong (distorted audio) with it but I can't figure
out what it is"?

Save your money and get a Collis S-Line, the newer Drakes, Swan, et.al.

(personal opinion off)

Some of the larger ham stores (Henry Radio, the "yellow sheets" advertised
in QST, etc) have some pretty good selections of used gear.

923. DEREGISTEREXTEXTRACT/APPEND RACT/APPEND Kenwood Interfacing

Newsgroup: rec.ham-radio
Date: 1989-05-17 23:36:25 UTC
From: 31005_1650@uwovax.uwo.ca
Message-ID: <2218@uwovax.uwo.ca>
Source record: 18693

I have just completed and have operational an interface for use
between a KENWOOD TS440s and any RS232 equipped computer. The interface
uses the MAXIM family of chips thus requiring only +5 vdc to operate.

The radio requires two interfaces that cost about $100.00 each. The
first interface consists of an 8251 programmable serial interface chip
worth about $ 3.00 and the second chip is a 4040 binary ripple counter.
These chips install under the metal RF shield located on the rear of
the front portion of the radio. Opening the top of the radio and looking
under the shiny tin RF shield will reveal the ONLY two empty sockets.

The second portion of the interface involves a device to convert the TTL
logic levels within the radio to RS232 levels. The following circuit
will allow you to operate a three wire interface between the radio and
your computer. No need to worry about RTS and CTS.

Parts :

1 - MAXIM MAX232CPE integrated circuit
1 - 74LS04 inverter
4 - 10ufd capacitors rated at 6.5 volts or greater

Wire the pins as follows :

MAX232CPE 74LS04

Pin Connect to Pin Connect to

1 n/c 1 n/c
2 n/c 2 n/c
3 n/c 3 n/c
4 n/c 4 n/c
5 n/c 5 n/c
6 n/c 6 n/c
7 pin 3 of RS232 port on computer 7 ground
8 pin 2 of RS232 port on computer 8 n/c
9 pin 13 of 74LS04 9 n/c
10 pin 10 of 74LS04 10 pin 10 of MAX232CPE
11 n/c 11 pin 2 of ACC1 jack on radio
12 n/c 12 pin 3 of ACC1 jack on radio
13 n/c 13 pin 9 of MAX232CPE
14 n/c 14 VCC 5 volts DC
15 ground
16 VCC 5 volts DC

Pin 1 of ACC1 jack on radio must be connected to ground.

I have installed this interface in the radio under the upper circuit board. I cut the cable going to the 6 pin DIN plug at ACC1 and installed this circuit in line. I now have true RS232 levels present on ACC1. The circuit is powered from within the radio. Current draw for the entire circuit is under 10 mA.

I also have available some prototpe code written in TURBO BASIC by Mark, VE3PZR available at request. The software demonstrates the basic principles behind interrogating the radio for information as well as setting modes on the radio. The interface on the Kenwood series of radios is much nicer that on Yaesu radios due to the fact that you can still operate the radio while the computer is communicating with it. The radio will send an update string once every 1.5 seconds while you are changing the settings of controls. With the Yaesu CAT system, you must turn the CAT interface on via program control. When this is done, the front of the radio is locked out until you disable the CAT. Programming is much simpler with the Kenwood line as commands are in straight forward ASCII sequences. The Yaesu CAT requires conversion to HEX and placing the resultant bytes in reverse order before sending them to the radio. I have written quite a comprehensive control program for the FT-767 which is also available to anyone who desires it.

SUBJECT: Scanner information wanted.

HELP - i need information on scanner marketplace. I need something that
will cover 66-88MHz and receive AM. ('How quaint' i hear you all cry, but
this is a strange world and theres not much I can do about it).
It must be ROBUST (i.e. it must have a metal case and be able to withstand
being dropped/sat on/bounced about in the back of a 4X4 etc). Should also
be waterproof - the speaker cone of my Regency 200 just dissolved
after 2 days of Scotch Mist!
Should be portable (but not miniature necessarily - to me if it weighs
less than 10 pounds complete, its portable!) Ideally it should be attachable
to a rucksac or other backpack so i can keep all my pockets free for other
things.
Should have ability for being on standby (i.e. switched on, squelch closed)
for long periods (2 to 3 days) without needing batteries changed - this
implies *BIG* nicads or lead/acid jelly-electrolyte cells.
Should have plenty of audio output (1 watt minimum).
I dont really need much sophistication in scanning - the ability to monitor
2 channels is all i need (sampling each one at one second intervals).

I guess none of the commercially available scanners really fills my needs,
certainly the little handheld Regency one only lasts 6 hours on a set of
nicads, so i end up with about 20 batteries in my pockets on field trips.

It might be possible to modify an air-band receiver (they use AM, but a bit
higher in frequency) by recrystallising and slugging the tuned circuits with
some extra capacitance to pull them down in frequency a bit.
Another suggestion that i have received is to get a commercial portable
two-way set and junk the transmit side, then build a 'scanner' to switch
between the 2 crystals (dead easy, a 555, an inverter, and a changeover
reed-relay, and possibly a transistor to stop the 555 when the squelch opens).

Any other suggestions??

I think that you are out-of-date about French phones as well as TV. As a result of a number of years of national crash project, French phones now really work. All numbers are now eight digits, with two regions (prefix of 1 to call into Paris area, no prefix for non-Paris to non-Paris. There are now real phone booths (boxes for the Gs). And you can understand what is being said on the other end of the line.

Actually, starting with an out-of-date system, they have been able to leap-frog into a pretty advanced system. I'm sure you know of the million or so Minitel CRT terminals, delivered instead of phone directories, but also spawning a very wide range of consumer information services unknown in most other countries. Just read the magazine and Paris Metro ads to be amazed at what you can do with your Minitel!

> radically different than say, a vanilla amp using a 3-500Z at 3 KV,
> which makes finding components quite difficult.

Why do this? (The merely obvious answer might be to avoid
building a 3-4 kv supply for proper vacuum tubes). Frankly, I can't
stand my Julian Betts AB10SG 10 kw AM transmitter (commercial
broadcast) which uses dual 4CX10000D's in a screen modulated circuit;
multiple sweep tubes have got to be at least as difficult to construct
networks and tune.

I have no idea what the continuous plate dissipation of the
6MJ6 tube is, but suspect that 30-40 watts is not unreasonable. For
400 watts plate dissipation, you'd need 10. At wholesale prices
this works out to $111.27 (from Richardson Electronics).
(The 6146A, with lower interelectrode capacitance, is $8.95/tube).
Now, a 4-400C is $120, a 3-500Z is $126.
Either amplifier will be infinitely easier to neutralize than
the sweep tube amplifier; although I'm sure the latter is possible.
Of course, an air-system socket is required for the 4-400C, and the
glass chimney is highly desirable.

I went down this path once in modifying a RCA BTA-1M transmitter
(for drivers) and was not impressed with tube life. In constructing
any circuit, it is not unusual to lunch receiving tubes...they
are not designed for momentary overloads. Improper loading
and loss of excitation can waste a sweep tube in a hurry. On
the other hand, the 4-400C and 3-500Z have some thermal reserve
and are rated for overdissipation during tuning.
Although the initial cost is somewhat higher, you can
probably find 4-400C's pulled out from your local AM radio
station that have plenty of life left for amateur use. Under
ICAS conditions, a 4-400C or 3-500Z (new) should last 5000
hours with a proper filament voltage management program.

Just out of curiosity, what are the operating con-
ditions for 10 sweep tubes in parallel?

I have a Bearcat 100XLT scanner that I listen to frequently. Our local police department is on 460.025, 460.150, 460.375 and 460.225. I also live right under the antenna (within 1 mile) of our Yellow Cab service, the EMS dispatch folks and some kind of paging service. The taxi service is on 473.??? (I don't remember exactly what frequencies) and EMS is around 450-460. The paging service must have a HUGE transmittter because their signal was so strong that it was getting into my aparment complex cable TV system.

Is there anything I can do about this? During emergencies or special events all of these frequencies become quite active but the scanner is severely degraded. When I am out somewhere it does just fine.

Thanks in advance.

> group already know about the system.

I know very little about it. The FCC did, however, reference it in the NPRM 87-14 for other purposes, namely a reason not to use 216-220 Mhz where an alternative for ACSSB uses could have gone. The Inland Waterways system had only recently been established, and its usage patterns could not be well esatblished yet. I agreed with the FCC attitude on that, and tried to get it extended to cover all of 220-225 Mhz because of the major changes that could result from the Novice Enhancement, changes now likely to be nullified by the current decision.

Well, sounds like you, and probably lots of others, need an elmer.
Have you tried the local radio club (if there is one), to see what
kinds of people are in your area? Lots of times clubs are a good way
to meet the kind of people who can "show you the ropes" as far as
getting a project started. That may not be the answer, especially
if your local club is more contest or dx oriented. Still, there may
be someone you can get next to who has the tools, time, and interest.
Of course, my feeling is that even if you find such a person, you
should probably start out with a (relatively) simple first project.
One that's got a high probability of success, no matter how badly
you goof it up- DON'T TRY TO BUILD AN SSB TRANSCEIVER YOUR FIRST
TIME OUT!!!

As you develop the necessary design and construction skills, then
you can tackle more serious stuff.

The bottom line is: I bet there are people in your area who would
welcome the chance to teach a neophyte how to roll his own. I have
made the offer of help many times in my area (Rochester, NY) and
although there wasn't much response at first, folks are coming
around now. I know I'm flattered when someone asks for my help with
a project- I'm sure most others of my ilk would feel the same. I
relish the opportunity to give back what amounts to a small part of
the help I got when I started out.

Hope this helps you some. Good luck.

938. Repeater Isolation without a Duplexer

Newsgroup: rec.ham-radio
Date: 1989-05-18 20:59:09 UTC
From: cep@lazlo.UUCP
Message-ID: <178@lazlo.UUCP>
Source record: 18711

My university club has basically decided that getting a 2m duplexer is not only a pain in the neck, but it's also expensive...we decided that a better alternative (at least from a $$$ standpoint) will be physical separation of the Rx/Tx antennas.

According to the book, at 146Mhz, 300' horizontal spacing will yield 60db isolation with a standard 600kc split. According to those specs, a 40' vertical spacing will also yield 60db isolation.

My two questions are:

(1) What is the relationship between spacing and isolation if we do BOTH - i.e. 300' horizontal and 40' vertical? I don't really believe that 60db from the horizontal plus 60db from the vertical would add up to 120db total isolation - but I don't really know!

(2) We are planning on using Ringo Ranger II's. I don't understand the relationship that the 7db gain the Ringo Ranger has will do to the isolation figures - i.e. will 7db gain, does that imply a 7db loss of isolation on the receiver? (if "gain" is the opposite of "isolation", that is, will they cancel each other in a linear sort of fashion?)

>Now, a 4-400C is $120, a 3-500Z is $126.

The only way I have seen "sweep tube linears" work is in SSB Grounded Grid service - AB1 I think. You are quite right about the plate dissipation, but the PEAK dissipation and allowable/achievable peak current is extremely high. Thus the 4 tubes for 1kw (PEP!). About 30 seconds CW ot "tune up" on one of these and you buy new tubes though.

For the unititiated, one of the "problems" with SSB is that the peak power is far higher than the average power. The 2:1 ratio applies ONLY to a two tone sine wave, uncompressed voice can easily be 10:1 or 20:1. Thats 20KW peak for 1kw average! Most amplifiers are limited in their peak output as well as their average output, so a 2KW PEP amplifier may only run at 3-400 watts average power with a normal voice.

Ah yes but we can compress the voice to get a better ratio. True but ANY change to the voice signal adds distortion and makes it hard to understand, or if the "compression" takes place in the amplifier (called "clipping" now) it produces "splatter" or spurious signals. Just listen to 20M SSB to hear lots of examples of both.

There are compressors that have been designed that will compress 10-20 db without "too much" distortion (define too much ...), but they are expensive. The "sweep tube linear" is a reasonable solution if (a) you don't run a compressor AND (b) you NEVER run CW or any continuous transmission for more than about 1 second at a time. This includes tune up!

> I went down this path once in modifying a RCA BTA-1M transmitter
>(for drivers) and was not impressed with tube life. In constructing
>any circuit, it is not unusual to lunch receiving tubes...they
>are not designed for momentary overloads. Improper loading
>and loss of excitation can waste a sweep tube in a hurry. On
>the other hand, the 4-400C and 3-500Z have some thermal reserve
>and are rated for overdissipation during tuning.

Tube life is not exactly great, but for most ham stations to put 200hrs of actual transmitting will be several years. Try a clock hooked up to you XMIT switch if you don't believe me. Thus tubes lasting 100hrs or so are quite reasonable. The sweep tubes are designed for momentary overloads with a thick anode which will absorb a lot of heat for a few hundred milliseconds.

> Although the initial cost is somewhat higher, you can
>probably find 4-400C's pulled out from your local AM radio
>station that have plenty of life left for amateur use. Under
>ICAS conditions, a 4-400C or 3-500Z (new) should last 5000
>hours with a proper filament voltage management program.

An excellent source if you run CW and have a limited budget BTW. The cost of the 3-4KV power supply is high though and not easy to duplicate by work arounds. I used 4 1940-50 "console" radio supplies to get 3KV at 700Ma peak once, but it was bulky and those old radios don't cost 50 cents each any more!

> Just out of curiosity, what are the operating con-
>ditions for 10 sweep tubes in parallel?

Never tried it, must be almost like a solid state amp. - 50 ohm output!

I have an ICOM u2AT and use it in my travels, usually for packet radio.
The portable antenna I use is a mag-mount. It works on most vehicles (Not Corvettes) and is good in offices on filing cabinets. Works in Motels on air-conditioning hoods. Works on fridges, and when all else fails, borrow or steal a cookie sheet. It also works fine on galvanised guttering. Fits in a suitcase. You can graft a sheet of steel into the suitcase and use that as a groundplane and airport security panic starter.

Yours

SUBJECT: 'Hotel-room' antennas.

Several people have discussed these recently. I have done some of the same
sort of things - a twin-lead j-pole hung from the window (it can be rolled
up and stowed away when not in use, so it doesnt attract the suspicious
attentions of the hotel cleaning staff!).
Another technique i have used on 'commercial premises' where a concealed
indoor antenna is needed is to use the self-adhesive foil strip thats sold
for home security systems (the stuff you stick to glass, so if the glass is
smashed, it breaks the strip and sets the burglar alarm off)
This can be bought from R.S. or your local security man.
It comes as a transparent adhesive-backed tape about an inch wide, with
an aluminium strip bonded to it (strip about 3/8 inch wide).
A simple vertical dipole can be made for 2 meters or your favourite VHF band
by sticking the stuff to the centre of any suitable window.
Very thin coax should be used to connect to the ends
of the dipole (i used small tags and small nuts/bolts with washers to clamp
the coax to the aluminium foil - careful, the foil can be easily broken by
excess flexing, or the weight of the coax. A self-adhesive cable tie can be
used to take the strain off the joint). Run the coax away from the antenna
at 90 degrees for at least 1/4 wavelength to avoid 'RF-on-the-braid' effects
You can set it for either vertical or horizontal polarisation depending on
how big the window is.

My experimental antenna showed less than 1.5:1 SWR between 144 and 146MHz when
the total length was 38 inches end-to-end, with a half-inch gap at the feed
point. Installed on the window of a 16-storey block, i could easily work
over 40-50 miles with a 5-watt TX. It also worked well as a scanner
antenna - excellent reception of the local fire/police departments.
Being a flat strip, its length/width ratio is better than simple wire,
this promotes a wider bandwidth than you would get with wire alone.

Theoretically, if your window is big enough, you could add directors and
reflectors, or even try making a Quad-loop. Rotating the beam may be a bit
of a problem though.
(ask for a room facing the way you want to beam?)

Possible problems - well, the foil tracking bonds quite well to the window,
and may incur the wrath of the hotel management when you vacate the room
and they find their windows covered with foil.
I'm told that some glass (the tinted variety) may be conductive to some
degree, or that there may be a partially conducting film laminated into
it. This would give some strange effects.
Also theres a risk of detuning and spurious coupling if the window frames are
metallic. I suppose someone will work out how to feed the RF straight into

the window frames and do away with the need for the foil. Wonder who will be the first to work all continents using a pair of end-fed windowframes at 200 feet?
Also, if you are thinking of running much power, the foil strips wont like it, if you put more than about an amp through them, they melt!
Dont stand too close to the antenna if you run high power - the effects of high-level RF on the human body may be harmful.

Happy Experimenting...

944. Crossed Field Antenna

Newsgroup: rec.ham-radio
Date: 1989-05-19 14:39:17 UTC
From: david@select4.uucp
Message-ID: <6198@ux.cs.man.ac.uk>
Source record: 18718

There has been some debate on the net recently about a Wireless World article on the "Crossed Field Antenna". Some people even thought it might be an April Fool's spoof. Well, an advert for a commercial version of this antenna has appeared in the latest UK callbook, and this may be of interest to the less skeptical.

The near verbatim text of this ad follows, but, note I have no connection with the company, and you should give the hype the consideration you think it deserves:

CROSSED FIELD ANTENNA All bands - Eighty to Ten Metres
Sensational Poynting vector synthesis, completely new principle. Pat Pend.
Model CFA 2: 0.4-metre diameter, 0.5-metre high, on a 1-metre by 1-metre mesh ground plane.
Highly efficient, receives and transmits, broadband (3.5 - 3.8 MHz without retuning). Minimal TVI problems (better than any wire antenna for EMC). Even flat dwellers can be on 80 metres. Very low VSWR, can operate inside loft or be placed on the roof. Planning problems solved!
Complete systems for up to 1kW including phasing unit: 450 Pounds Sterling inc. VAT and postage.

Hately Antenna Technology (GM3HAT),
1 Kenfield Place,
Aberdeen AB1 7UW,
Scotland.

I think you will agree that this sounds revolutionary, so I will send for technical info, and if anyone is interested I will summarise on the net.

Does anybody know of a good reference that would explain the algebra related to point angles resulting from the Bahn Coordinates? I could also use a good verbal definition of how the coordinates are expressed. I think I have the basic idea, but I have never seen these mentioned in any Satellite handbook I have seen. Bahn coordinates are mentioned all of the time in the AMSAT bulletins, so I guess they must be used by a healthy number of people.

Thanks in advance to anyone who can provide this info. 73 de KB4CNQ

+
+> Are there any schematics out there for a 1KW HF amplifier that uses the
+> 6MJ6 sweep tube ? I'm having a little trouble designing a plate tank

In the 1971 issue of the Radio Amateurs Handbook you will find a circuit that uses 4 sweep tubes of this type. Actually, any of the common types can be used. 6LQ6, 6LF6, 6CE6, 6MJ6..ad absurdum. BUT- remember! These kinds of amps are very seldom operable in any mode but SSB (drive it light, the glass envelopes won't take much!) or light-duty CW.

+> for these beasties, due to the huge inter-electrode capacitances
+> generated by 4 or 10 6MJ6s in parallel. The TUNE and LOAD values are

Nope. Forget it. More than 4 tubes of this type is gonna be a kludge, and worse yet; the harmonic content of your output is going to be about 2 dB below your intended signal. Can't really tell you why, it just works out that way. In a prior incarnation, (God, it was hell on 11 meters! :-)) I've serviced a few of this kind of amp. One of them, the "Golden Falcon", used 10 6LQ6's, the tube life was very short with AM use, about 4-6 months! If run in SSB service, the tubes would last a year, max. The damn thing had a s-cage blower in it, and on-the-air it sounded like a truckload of turkeys crashing thru a gay-bar at happy hour! VERY BLOODY-WIDEBANDED! LOTS OF TVI! ..despite all attempts at adjustment, running at full power, the design is not exactly "good engineering practice".

+> radically different than say, a vanilla amp using a 3-500Z at 3 KV,
+> which makes finding components quite difficult.
+
+ Why do this? (The merely obvious answer might be to avoid
+building a 3-4 kv supply for proper vacuum tubes). Frankly, I can't

He's right. Don't be lazy, build a good power supply so you can run a proper tube, the sweep tube linears are mostly junk! Besides, you cannot run them with packet, AMTOR, RTTY or really hot CW anyway...

+ Just out of curiosity, what are the operating con-
+ditions for 10 sweep tubes in parallel?
+
It borders on desperation. ;-)

Re: why do this ?

I picked up the amplifier at a flea market from a CB'er. Four tubes were feeding six. At 4 watts input, I got about 350 watts out. The problem is that my 100-W xmtr can't go that low ! I've already fried the input matching network.

Re: operating conditions

For class C, 1 KW in, Rplate = 500 at 990volts (max for the 6LQ6). I found some specs, and it's true that it could handle the momentary overloads of SSB, since it can dissipate 300 W for 20 seconds. However, the pi network caps are huge - about 10X anything I've ever seen.

I found some specs after calling all the TV repair shops in town. I've also found a couple schematics for 4-tube amps (500W SSB). Thanks to all the responders.

I found a cheap source of 3CX250Bs in the chip fab here at the plant, so I'll probably go that route. Path of least resistance and all that.

SUBJECT: Band-plans

Recent discussion on people 'Hearing SSB in the CW section' of 21MHz etc -
just to clarify the situation here in the UK (and i beleive most of Europe
too!).
UK licences are of 2 classes - 'A' (26dBw transmit power, all modes, all
bands, 12WPM code requirement) and class 'B' (26DbW transmit power, all modes,
all bands from 6 metres upwards, no-code).
The band-plan in the UK is *VOLUNTARY* hence you can transmit anything
you like in terms of modes, anywhere you like in the bands for which you
have permission (but you wont make many friends). There are no compulsory
CW or SSB 'segments' as in the States.
Hence if you hear something that doesnt fit with your national band plan,
just remember that there are other countries which dont subscribe to the
same architecture as yours! In practice, it all seems to work OK, until
you get odd band conditions. For example when theres a lift on 2 meters,
everyone goes mad in Europe, and the normal SSB calling frequency (144.300)
turns into a wall of white noise. Problem is, everyone thinks that you must
call on the calling frequency. This is fine when activity is low (when i am
in the far reaches of Scotland, i can beam south and hear *NOTHING* on the
calling frequency for DAYS on end!!!!) but during openings, the only sane
thing to do is to find an apparently unoccupied frequency, and then call.
Then, at least you stand a chance with relatively low power (100 watts PEP
to a 9-ele beam) whereas on the calling frequency you are mixing it
with the big boys (400 watts to 4*9-element beams at 150 feet) and you dont
stand a chance!

ALSO remember that some of the bands in the States are different in the
rest of the world - for example we have '80 metres' 3.5 to 3.8MHz
whereas in the States you call it '75 metres' 3.5 to 4.0MHz. Calling for
Europeans in the 3.8 to 4.0MHz band is likely to be met with deadly silence
(or at best, the BBC World Service - these frequencies are used as a
shortwave broadcast band !!!!!)

Those of you interested in the discussion on building electronic gizmos might find this book interesting: SILICONNECTIONS by Forrest Mims. I found it at the local library and read it a few weeks ago. Copyright date is around '86 or '87, I think. Mims is one of the people who designed circuits, wrote a lot of the project-construction articles for Popular Electronics, and had a column there. He was involved with the MITS organization, wrote the manual for the Altair microcomputer, and his name probably is familiar to anyone who was into electronics as a hobby in the past decades.

Anyway, his comments on the way the hobbyist-electronics magazines changed over the years, and particularily how the project-construction emphasis changed, would be interesting to anyone who cares about home-building electronics. Probably would be worthwhile checking your local library for that book next time you're there...

RE: DUAL-BAND HT FEEDBACK

Earlier this month, I asked the INFO-HAMS "world" a question pertaining to dual-band HTs. I got such a good response to my inquiry, I thought I'd share a few of my my "answers" back with the INFO-HAMS group. Hopefully, this feedback will be of benefit to someone.

My initial inquiry went as follows:

ATTN: DUAL-BAND HT OWNERS!

I'm in the market for a dual-band HT and want to know if any of y'all have had any experience, good or bad, that I may profit from?

I'm leaning toward the YAESU FT-470 because of its price, size, memory management features and autopatch auto-dialer. Also looking at ICOM's IC-32AT and the new KENWOOD TH-75A. The FT-470 is the least expensive of the three (I found a source that quoted me $479). I've always been an ICOM-man in the past, but I have an open mind.

Candid owner/operator comments are what I'm looking for. If you had it to do all over again...which rig (if any at all) would you go with? Any regrets in going dual-band on a HT platform? Etc., etc., etc.

With the price of these rig's being what they are, I need to do it right the first time!

THANKS!

Martin Mullican, KB5JDQ

Here are some of the responses I got from you, the INFO-HAMS folks.

Martin,

I purchased the Icom IC-32AT at Dayton Hamfest. I had looked at and talked to the owners of all the dual band talkies. When I started looking I had a strong bias towards the Icom because of the accessories that I already had. At Dayton I saw the Yaesu 470 and several hams that I know bought them outright. After playing with one for a while I almost went inside and bought one but then I stopped and talked to the fellow that is at most of the major hamfests who does all the mods to the radios. When I found out all the things that he could make the 32AT do I decided to go ahead and get one and also protect my investment in Icom accessories. One of the mods that he makes converts the 32AT into a cross band repeater without any external hardware. I bought it from Universal Amateur Radio in Reynoldsberg Ohio for $499. I did buy the Yaesu 4700 mobile dual band

radio though.

Randy Jarrett WA4MEI

Martin:

I have owned a Yaesu FT-727R for about a year now and love it. However,
it is nothing compared to the new 470.

The dual band HT is great and I don't think I would sacrifice it for anything
else. Even though you lose some of the convenience of a small package that
is available in some of the mini-HT single band rigs, the performance that
most dual bands offer is much superior.

I am trying to sell my 727 so that I can move up to the 470 quite soon. One
of my close friends bought the 470 in Dayton and he loves it. It has more
features on it that all of his other equipment combined! Five or six of
the other guys in my repeater group have ordered or are planning on ordering
one within the next few months.

On the other hand, one of our group bought the Icom 32AT and is very happy with
it, although it doesn't have as many bells and whistles.

Getting off the subject, would you know of any of the crews from your base
coming up to the London International Airshow on June 3 & 4. We are setting
up a special events station and would like to get this out to a few of the
crews to see if we can get some good contacts. Any help would be appreciated!

Hope this info is of some help.

73 de VE3ZDC...Dave Colvin
Univ. Western Ontario, London, Ont., Canada

Martin:

I own a ICOM 32AT .. and could not be happier with it. This HT has given
me no trouble at and has EVERY feature you could possibly want. This
bulletin board has had some horror stories lately about the Yaesu HT, and
has for the brand new Kenwood HT .. I would wait a year before buying it.
I know that the 32AT is a little pricy ... but believe me ... it is well
worth it.

Fred J. Stellabotte - N2JCD

Martin,

If you've "always been an Icom man", you'll find the IC-32AT satisfying, and
will continually wonder upon hearing all the HT-of-the-week weenies talking
about the more-memory, more-features Yaesu and Kenwood handhelds whether you've
done the right thing after all. Until you start dropping the set off tables,
onto driveways, and the like. Now, I'm told that the small-format Kenwoods
withstand similar abuse well in their own right, although those I've seen that
have been the unplanned objects of such "testing" do end up a bit more scarred
>from the experience than the Icoms (an ABS vs. Icom's polycarbonate case would
seem to be the reason). As an Icom man, you already have a complement of

accessories, all of which will work with the '32 (obviously excluding the DC adaptor for the older 10.8v models); get another manufacturer's HT, and welcome to the land of extras all over again (and if you thought Icom accessory prices were a bitch, add another five or ten percent and you've got Kenwood prices).

I got my '32 in February and as you can guess, am pleased with it. I have noticed that the receiver appears to be a tad less sensitive than the '02 on 2m and my Yaesu FT-708R's on 70cm, and (corroborating someone's recent posting on rec.ham-radio) the s-meter is stupidly over-scaled ("s9" readings with the squelch not set high but still closed are irksomely common). The dual-band antenna (like all dual-band HT antennae I've ever seen) is the weak link in the tumbling-drop scenario, and with any dual-band HT, should probably be considered a consumable item, hi. The available soft case isn't quite as nice as the older soft cases with their fabric seam-reinforcements, both in terms of looks and utility (I ceased dicking with the top flap that's a separate piece on the new case and which opens rearward, in fact must be opened to get to the keypad; I have thrown it into the junk box after finding that even after mods with an x-acto knife, it still is a nuisance). Icom decided to use up their inventory of belt clips left over from the micro-nAT line by incorporating them into the '32's design, and these are a minor liability in that under the wrong circumstances, they can bend open if the rig snags on something while still mounted on your belt (and the snag-likelihood is enhanced by the clip's design's causing the radio to ride 1/4" to 1/2" lower on your hip). I've noticed that if you are feeding DC station power to the rig into the top jack, if that power is interrupted (e.g., by jiggling the plug), the set is prone to lose information that you've stored in memory (not a problem if you are careful never to insert/remove the plug unless the set is switched off first, and I've not yet had any problems from mobile vibration with the power plug; I encountered the memory-loss-from-power-glitch phenomenon when heavy-handing the plug in the shack only).

Not being constrained by a choice of obsolete microprocessor technology in the design (as the later '02AT et al were), Icom has been able to update the control software while maintaining the good parts of its old look-and-feel. You'll find operation of the set will come to you quite naturally if you've been using '0n series sets. The three jacks on the top panel are now mounted in a rubber block that provides a nice extra cushion against physical shock (the mic jack on my '02 worked loose and now keying through it is intermittent; I don't anticipate ever having this kind of problem occur with the '32). The rubber caps for the jacks are now captive instead of eminently loseable; only the BNC cap is detachable, and the BNC is now recessed into the top plate, so this one is less likely to go flying away when you detach from things in a rushed situation. Battery consumption seems to be on a par with my '02AT (I use BP-8 or CM-8 packs almost exclusively). One odd observation is that when the battery is low, it will die on 2m transmissions (and the display will flash when the transmitter is keyed) but will continue to transmit on 70cm for a good while longer (on 70cm, when the transmitter is keyed, the "TX" led will light and immediately go out instead of staying lit, and full power seems to be developed anyway, until the battery really is down). The '32 receive audio is louder than the '0n's, which is a mixed blessing in light of the dirty squelch tail (no dirtier than the older Icoms, just more obtrusive now when making use

of the capability to turn it up louder).

I hope this top-of-the-head user report proves useful to you. Let's hear what you ultimately decide to get. Good luck!

73 de KB6OWB!
Harris

Martin,

I have been the somewhat satisfied owner of a Yaesu FT-470 for 3 weeks now. Their are a few things wrong with the rig that I flat out believe are due to dumb engineering. The radio *IS* a pretty nifty rig on the whole, however.

First off, the few things mentioned on INFO-HAMS have been checked out by me, KB7Z, and N7CTM. We all possess 470's. My rig and KB7Z'z are consecutive serial numbers 90243 and 90244. Having a rig out of the first thousand can have it's drawbacks.

The problem about the 17.3 MHz IF is indeed true. Our local NOAA weather station is on 162.475. I took my FT-23 and dialed up 145.175 (in the band plan allocated to linear translator outputs, none in this area) and sure enough when I keyed the transmitter, NOAA popped out on the FT-470. It could be a big problem for people in Cincinnati... Better engineering could have prevented that problem.

The second OH FU I have found is annoying because it's a goof that I feel only a novice or an engineer with a deadline would make. If the radio is *NOT* receiving a signal on *EITHER* band, the speaker is totally silenT. No problem. Just what you'd expect. If you are monitoring both bands with one band inactive and the other band receiving a nearly full-quieting to full-quiet signal, you can hear the unsquelched inactive band audio about 20 to 30 db down under the audio from the active receiver. I think any sane engineer would have designed the radio such that an inactive receiver would have it's audio completely muted going into the audio mixer. If you are outside or in a car, it isn't really noticeable unless you are listening explicitly for it. Indoors in a reasonably quiet room, you can't really avoid hearing it. Some people think the received signal isn't full quieting. I haven't been out to the shop yet, but one of these days when I am, I'm going to hook it up to the communications monitor and measure the level of the squelch noise and write YAESU a nasty-gram. Actually, I'm told that Yaesu knows about some of problems and is going to do some corrective engineering. It wouldn't hurt to call them (1-213-404-2700 or I think 1-800-999-2070) and mention the problems and see what you can find out. Maybe they'll get enough abuse that they *WILL* fix them.

On the other hand, the features designed into this rig make it very desireable. Since we don't have local repeater outputs screwing around with local WX stations in the receiver front ends, the first problem *isn't*. I live with the squelch mute problem by baising the balance control toward the primary band which helps. The new Kenwood HT has only two channels on

each band that carry "odd" splits. All others have to conform to band plan. :-(= It only has 20 memories per band, as I recall. The Yaesu has 21 memories/band *ALL* of which can be programmed for any split. The "standard" split selected is changeable. The offset is also changeable. It will store ten 15-digit phone numbers in the autodial memories. The frequency increment in VFO mode is programable as well.

Where I work, we hold a license in the Experimental Radio Service for about a dozen frequencies between 152.0 and 159. MHz. The license limits us to a power level of which I can't recall (25 watts?) and has a waiver on the type acceptance requirements. The only requirement is that its up to *US* to correct any interference problems that we cause. We build and use a lot of little 1 watt transmitters to remotely acquire data in the field for our research. Hence, I am awaiting the Technical Manual (supposed to be available in June) to see if (1) it can be modified for out-of-band transmission and (2) it will cross-band repeat.

In closing, I must say I really have no regrets that I purchased the FT-470. I have already found it very convenient vs packing around either my FTH-2005, FT-23R, or FT-73R. KB7Z has a Kenwood UHF handheld (I can't recall the model. He preferred it to the FT-73R, but now carries his FT-470 around. He also has and likes his Kenwood 721 Dual Band rig, so he isn't really biased one way or the other unlike me. I'm an old Icom man, too (IC-230, IC-22A, IC-2AT).

Since I'm starting to ramble I'll close this out. Hope you find this of some use.
73,
Reid

Martin,

I have the ICOM, and would do it again. The Yaesu and Kenwoods aren't up to the Icom in quality. The Yaesu is very attractive, I'll admit. I've never owned any other units, so this isn't worth a lot.

Martin:

I too have just went through the dual-band HT study. I was serious about the YAESU FT-470, but after talking to several people who are strong YAESU fans, I had second thoughts.

They always seem to have one problem after another. You will also notice a lot of notes bandwidth concerning image problems that this new model has.

Many of the local ARES and CAP groups use ICOM and swear by it. I was convinced, and bought the ICOM 32AT and LOVE IT!!

Jeff, WO0J

In closing, let me say THANKS for all your help folks!

73,

Martin Mullican, KB5JDQ
Kelly AFB MARS
San Antonio, TX

P.S. I bought the ICOM!

957. Re: Dual-band HTs (Yaesu vs. Kenwood)

Newsgroup: rec.ham-radio

I use a Yaesu FT-411 (2m) and a Kenwood TH-315A (220). My impression is that these are a good deal like the FT-470 and TH-75A respectively. My opinion is that Yaesu wins hands down on the features, but that Kenwood walks away on performance.

The 50 memories in the 411 mean you can program in every frequency you ever use, even those you only use on trips. The DTMF memories are great for repeater control sequences. The worst feature of the 411 (and the 470 is just the same) is the *extremely* low volume. This radio is *not* useable outdoors unless you use a lapel speaker or earphone. The 411 also suffers from desense and cross-mod in RF-hot locations. It seems to me that there is some synthesizer LO noise apparent in the receiver audio.

I miss a number of the 411 CPU's features in the Kenwood. However, there is plenty of audio, and I have seen no indications of front end overload. My impression is the the 315 is somewhat more sensitive than the the 411, but I have not measured this. The Kenwood gives enough warning of dying nicads to finish a QSO, while the Yaesu just quits. Note that although the TH-75A looks like the TH-2/315, it uses smaller TH-25AT batteries, changers, etc -- that's a drawback if you have 2/315 accessories already. Both the 315 and 411 have gotten compliments on excellent TX audio quality.

A fix for the 411/470 low audio is available from Engineering Consulting in Brea for $23 (714-671-2009 or see any of the ham mags). This is a relatively clean mod, but not for the faint of heart - t'aint much room inside there. See the June issue of 73 for a review of the 411.

I'm waiting for the TH-75A to show up in local stores. I want one.

Just a quick note while the iron warms up ...

>Peter Morgan:
>Does anyone out there actually BUILD gear any more? Almost all the hams I get
>to talk to nowadays can do nothing but quote 'rice box' model numbers at me
>and little else. Do we all have too much money (I certainly dont!!)... Think
>about it - when did *YOU* last *BUILD* something......

For me it's still Amateur _EXPERIMENTAL_ Radio, and these days T.V. too!
Sure, I buy to save the chore of re-inventing the wheel, but then I fix the
rice-box or whatever so it has the features I really want, which the
manufacturer forgot to put in.

Most of my time I spend building stuff that you just can't buy - like
microprocessor controlled 2kW 1200MHz ATV repeaters, and multiplexed
digital audio link systems.

I don't have much interest in rubber-stamp "QSO'S" on long waves, and
probably most other constructors don't either, so it's not surprising that
you don't get to talk to many. Now if you call me on 10.150GHz .....

Gotta go - the iron's hot .....

962. Re:TM-721-A UHF GENERAL COVERAGE MODIFICATIONS

Newsgroup: rec.ham-radio
Date: 1989-05-20 02:37:25 UTC
From: dea@drutx.ATT.COM
Message-ID: <31164@sri-unix.SRI.COM>
Source record: 18736

First off, I want to thank Fred Lloyd, KJ6RK, for the excellent information that he gave us on modifying the TM721-A for UHF "General Coverage" . If you have made the mods though, you have no doubt found out that the receiver just can't seem to work much above 455.650 Mhz.

Not being terribly familiar with Phase Locked Loops, I feel like its out of my league to chase this one too far. But for those who are knowledgable (sp?) about those things, here is what I found. I took a Cushman FM signal generator and started walking up the band in 25 khz steps, setting the Cushman first and then tuning the 721. At 455.650 Mhz the receiver would no longer solidly receive the signal, but instead it would slowly oscillate at about a 2 cps rate between white noise and a solid full-quieting signal. My guess between playing with the radio and talking to Fred Lloyd is that the PLL circuitry is simply at the upper limit of its range. Unfortunately, almost all of the local police frequencies that I want to listen to are in the 460-462 Mhz range.

I want to point out that when the receiver was tuned to 455.625 the PLL was working normally and I was able to receive a full quieting signal with a .5 microvolt signal, so we know that the problem isn't sensitivity. I suspect that there is a way to drag the VCO voltage "UP" so that you could use the "General Coverage" spectrum at the expense of the lower part of the amateur spectrum.

At this point I'm going to throw the challenge back out there to you wizzards that eat and breath this digital/analog stuff to try and figure out what kind of alternatives are available to squeeze a little more out of the radios' UHF spectrum.

963. HF Propagation to HC8

Newsgroup: rec.ham-radio
Date: 1989-05-20 02:37:41 UTC
From: n2ic@drutx.ATT.COM
Message-ID: <31166@sri-unix.SRI.COM>
Source record: 18737

Here is a MINIPROP (TM) run on the path from California HC8.
It confirms my intuition - almost any time of day or night should
work on 20 and 15 meters.

To help you interpret these results...
The numbers given under each frequency are the absolute signal levels
(based on some reference power and antenna). Obviously, the higher
the number, the stronger the signal. The letter "A" after the number means
that the frequency is above the E-layer cutoff freqeuncy (ECOF) and below
the Maximum Usable Frequency (MUF). This is optimum !
The letter "a" after the number means that the frequency is below the
ECOF - probably lots of absorption (i.e. the signal levels may be overly
optimistic). The letter "B" after the number means that the frequency
is greater than the MUF, but less than the Highest Possible Frequency (HPF).
The band may be open, but don't count on it.

In conclusion, look for the highest signal levels, with the letter "A"
following the signal level. Plan your schedule accordingly.

By the way, MINIPROP (TM) is available from W6EL.

Good luck !

(personal opinion on)

Take a look at the inside of the "new rigs". 'Think you could fix it if
something stopped working? Fat chance! You are dependant upon the
dealers and manufacturers to do the job. 'Probably need computer diagnostics
also plus documentation.

The "old fart" rigs are simple, easier to repair, more-forgiving to
lousy antenna matches, and generally have more power output. You can
get them with the necessary items (dual VFOs, etc). You can also build or
buy a simple digital frequency readout for under $100. if you wish.

And... spend less than 1/2 the bucks.

My old "toober" still gets 200 watts out, has the original tubes, and has
a ton of hours on it (Swan 350C, 19 years old).

Yeah, the new rigs are fun. You almost always need more power with them
and... How many people have you heard on the bands saying: "my ricebox
has (static) something wrong (distorted audio) with it but I can't figure
out what it is"?

Save your money and get a Collis S-Line, the newer Drakes, Swan, et.al.

(personal opinion off)

Some of the larger ham stores (Henry Radio, the "yellow sheets" advertised
in QST, etc) have some pretty good selections of used gear.

I will be posting a message to the net soon regarding a modification to the Kenwood TH-25AT & TH-45AT. I modified mine so I can receive (and transmit) outside of the range in which the radio covers when it comes from the factory. From the factory, without adjusting the PLL, the 70cm radio covered from 427-456 MHz (after opening up the coverage range as controlled by the ASIC CPU). I "retuned" the VCO so that the radio now covers 439-468 MHz. This retuning was easy, and required only a screwdriver, and a scope.

I also opened up the tuning range on the 2m unit, but did not retune the PLL. The 2m PLL locks up in the range from 136-166 MHz. I may retune the 2m rig in the future so I can hear the railroad stuff.

Look for the discussion of this modification in about 4 weeks after my current term is over. Until then, I won't have the time to do it. In addition, some of the documentation is at my sister's house in a city about 80 miles distant. Please QRX.

Disclaimer: I do not endorse the illegal activity of transmitting on a frequency for which you do not have a license, and/or using non-type accepted equipment.

Stupid Question: When will the Japanese build 70cm radios for the amateur service in the United States which have receive coverage outside the amateur band. Lord knows there's a fantastic market, and a great potential for $profit$!

I couldn't agree more. I can't imagine being interested in radio or even computers without being able to swing a soldering iron. It is of course yet another essiential field of knowledge that is neither taught nor tested in the amateur licencing prceedure. Wouldn't you rather have today's new amateurs be able to solder a PL-259 than read CW? Stupid question I know, someone will disgree and accuse me of encouraging delinquency and degeneracy.

When I have taught amateur radio courses, I have offered a "Come back and learn soldering and construction after you take the exam". Not many takers I'm afraid. But the offer is always open. If anyone reading this lives in Southern California, I will offer to teach them all I know on construction, parts scrounging, recycling wire coat hangers as antennas, etc.

Lets face it, knowing how to build, alter and modify stuff can make amateur radio affordable. If you can use simple tools, you need never buy an antenna. You also never need to pay $25.00 for an RS-232 cable that you can build for $2.00, or cheaper if you scrounge or recycle the parts.

Then of course Joseph makes the rash assumption that Electronic Engineering graduates can build stuff. I wish that were true, I have had to teach a few, who had never actually soldered anything. They do all theory and a little bit of plugging ICs into proto-boards these days. Maybe when all the old guys die soldering will go the way of French Polishing and plastering.

But I digress, we do need "How to build stuff" courses. Maybe the ARRL can get behind this. Maybe High Schools can teach this. How about something really radical like "Become a HAM and learn how to build electronic gizmos."

Yours

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

In article <7880048@hpfcdc.HP.COM> perry@hpfcdc.HP.COM (Perry Scott) writes:
>Re: why do this ?

>I picked up the amplifier at a flea market from a CB'er.

Your first and biggest mistake right there! Every CB "linear" that I have ever seen was (a) GROSSLY overrated as to its power capability and (b) had a spurious output that had to be seen to be believed. There used to be one operated mobile in Clearwater Fla. that put out more power on 2M than 11M. We used to hear it override repeaters all over town.

For CB use they are illegal, for amateur use they are JUNK! I have been offered many at hamfests and flea markets and their owners get insulted when I tell them that the case is worth 50 cents, the connectors about 10 cents and I would throw the rest in the trash!
Four tubes were
> At 4 watts input, I got about 350 watts out. The problem
>is that my 100-W xmtr can't go that low ! I've already fried the input
>matching network.

Be sure to measure the freq. of the output! Bet most of its not where you think it is! And the front panel says something like 2KW linear too right? At 350 actual watts, that is higher power than most such "linears" put out though.

>I found a cheap source of 3CX250Bs in the chip fab here at the plant, so
>I'll probably go that route. Path of least resistance and all that.

A much better choice - you won't regret it.

Has anyone actually seen a Kenwood TH-75A that was for sale?
I'm referring to the new Kenwood miniature dual band handheld
radio advertised on the back cover of the May 89 QST.
Is it still vapourware?

E. M. ZANDONINI, W3CDQ, SILENT KEY

Extracts from obit in the "Washington Post":
Elizabeth M. Zandonini, 90, a retired radio aide with the National Bureau of Standards who had been an amateur radio operator for more than 70 years, died of cancer May 16 at Sibley Memorial Hospital. .... During World War I, she earned a commercial radio license. After the war she used her radio training to teach Morse code to hospitalized veterans at Fort Meade and Fort McHenry in Baltimore. ....

The following bio is from the book "Achievement in Radio: Seventy Years of Radio Science, Technology, Standards, and Measurement at the National Bureau of Standards". U. S. Government Printing Office, 1986.
--- quoted ---
Miss Elizabeth M. Zandonini entered the Radio Laboratory on July 28, 1921, as a radio aide. Her career with the section, and later with CRPL (Central Radio Propagation Laboratory) was to be a long and colorful one. In the same year that she joined the Bureau, Miss Zandonini became owner and operator of amateur radio station W3CDQ, a Washington-based station, and one that she continues to operate. Because of her many activities in the Radio Section, a deserving appellation would be that of a "factotum excellentia". Among her many duties and special abilities in association with the Radio Section were: librarian, office clerk, typist, compiler of bibliographies, searcher of the technical literature, translator (French, German, Italian, and Spanish), laboratory assistant, radio operator, lecturer, writer, guide, and hostess. EMZie elected not to follow the Central Radio Propagation Laboratory to Boulder and transferred to the Bureau's Radioactivity Section (Radiation Physics Division). She retired from the Bureau on June 30, 1965.
--- end of quote ---
EMZie was a mainstay of the old Washington Radio Club. She operated the HF bands, almost exclusively CW. She appears in a number of the QST pictures of the "Governors-to-President Relay"* in the 30s.

73, Bob, W3OTC
---
* What? At the time of each U. S. Presidential Inagural, hams collected congratulatory messages from the state governors and relayed them to the Washington Radio Club. There was a little ceremony when they were all delivered to the new President.

Date: 19 May 89 10:17:45 GMT
From: portal!cup.portal.com!AllanWS@uunet.uu.net (Allan W. Schlaugat)

Subject: Novice 10 Meter Question

The last 5 days on 10 meters has given me much excitement. While I have logged dozens of stations on 40 and 15 CW so far in my 3 week Ham Radio career, I have doubled that total in just 3 days on 10 meters USB. No "DX" stations yet, just stateside...until tonight (I think?!?!).

I was mobile with my HR-2510 (25 w) in Western Wisconsin listening for any W4s or W5s to chat with to make the trip go quicker (mobiles aren't choosy either!! :-) when I heard "it." Sandwiched between two W4's was a weak station was calling "CQ". What did I have to lose I thought...so I called back to him. All I got out of the QSO was a exchange of call's and names until the W4 QRM and QSB did him in. Humm...WH6CDR...California! Not bad for 0320-GMT and 25 watts. Later that night a friend told me that WH6 was HAWAII!!! Wow!

Now the questions to "the net" (aka My Elmers :->)...is this normal? I am not a QSL hound, but what is this guy's address so I can send him a letter (I don't have a "Callbook")? What do I have to look forward to on 10 meters this summer? I mainly thought of just ignoring 10 meters most of the time but...

Thanks!!!

==========

Allen,

RE: Your message listed above.

Welcome to 10-Meters!!!

Yes, contacts like the one you mention above are not un-common at all on 10-M right now. Band conditions like the ones you experienced should be routine for the next 24-30 months, too! It's especially neat to know that with 25 watts and a "wet noodle" for an antenna...you can easily work the world. No 6-element "super-beams" up 150' plus 1,500 watts needed here.

As you work/listen on ten (especially between 28.3 and 28.5), you'll hear folks ask for/give their 10-10 numbers. These folks are members of 10-10 International, a world-wide "club" for people who LOVE 10-M.

You need to get in touch with 10-10 International and find out more about 10-M and how to better exploit/enjoy this great amateur band!

Just send a S.A.S.E to:

10-10 International
Attn: Chuck, W6YLJ
18130 Bromley St.
Tarzana, CA 91356

Ask for a 10-10 "information package."

28-Mhz is HOT!!!

Marty, KB5JDQ

AO-13 STAYS ON DURING PERIGEE

HR AMSAT NEWS SERVICE BULLETIN 139.01 FROM AMSAT HQ
SILVER SPRING, MD MAY 20, 1989
TO ALL RADIO AMATEURS BT

AO-13 Transponders To Be Operational During Perigee Until August 16th

AMSAT Ground Command Stations, DB2OS, G3RUH, and VK5AGR, have been for the past several months been studying the battery conditions on AO-13 and usage of the transponders, and have decided that it is now safe to allow "perigee" operations of the transponders on AO-13 beginning May 14th and lasting until August 16th. An important factor which has influenced their decision is the fact that AO-13 will be in "full-sun" conditions for the next three month. Also, the position of the orbit with respect to the sun during this time period will provide very good sun angles for solar panel illumination. Normally there has always been a "perigee-shutdown" of the transponders but with the batteries in such good shape, the Ground Command Stations are interested in seeing how this "full-time" operation will affect the "battery power-budget." If it is found that this extended operation causes a "negative power-budget," operations during perigee will cease. As usual, listen to the General Beacon on AO-13 at 145.812 MHz for immediate updates to the operating schedule. As general rule, AO-13 users should always be cognizant of their RF power output. But during these new "perigee" operations, you should pay special attention to WATCH YOUR RF POWER OUTPUT and not use any more power than is necessary to have a return signal strength no louder than that of the General Beacon. Operators are encouraged to experiment with QRP operations during this time period in which AO-13 is passing the closest to the Earth.

The following will be the operating schedules for AMSAT OSCAR-13 for the next several months. Please post this in a convenient place in your ham shack for quick reference.

M de VK5AGR 14May89: *** AO-13 Transponder Schedule Update ***
14May89 to 14Jun89
Mode-JL from MA 160 to MA 200 ! Mode-B from MA 200 to MA 160
Also, for a trial period the OMNI-directional 70cm antenna will
be connected to the Mode-B RCVR from MA 20 to MA 40. These changes
have been introduced to enable stations who have access around

perigee to experiment with perigee operation. Mode S unchanged.
14May89: BLON/BLAT 212.0/+2.4 with a drift rate of 0.016/-0.061 deg/day,
respectively.

O S C A R - 1 3

Date : 14Jun89 until 16Aug89 ! 16Aug89 until 16Nov89
Attitude: 180/0 ! 210/0
Mode-B : MA 0 to MA 110 ! MA 3 to MA 160
Mode-JL : MA 110 to MA 145 ! MA 160 to MA 200
Mode-B : MA 145 to MA 255 ! MA 200 to MA 240
OFF : % ! MA 240 to MA 3
Mode-S : MA 150 to MA 160 ! MA 210 to MA 222

Transponders will be in operation during the whole orbit from June 14 until
Aug 16 due to excellent sunangle and power budget. No perigee operation
between August and November due to perigee solar eclipses!

MICROSATS LAUNCH DATE CHANGE

HR AMSAT NEWS SERVICE BULLETIN 139.02 FROM AMSAT HQ
SILVER SPRING, MD MAY 20, 1989
TO ALL RADIO AMATEURS BT

Arianespace Officials Now Say MICROSATs Launch Set For November 9, 1989

During this past week, Jeff Zerr (AMSAT-NA Engineer-in-Charge of Mechanical
Assembly for the MICROSATs) has been in Kourou, French Guiana discussing
important issues about planning and logistics with Arianespace officials
concerning the up coming MICROSAT launch. Arianespace officials have now
informed AMSAT-NA that the launch for the MICROSAT launch has been "pushed-
back" and is now pegged for November 9, 1989. This particular mission in
which the MICROSATs will fly on is commonly referred to by the French as a
"call-up" mission. It is called this because the primary payload, the SPOT-2
earth resources/photo-reconnaisance satellite, is being launched is to replace
the aging SPOT-1 which has been operational for several years now. The idea
behind this "call-up" mission is to replace SPOT-1 ten-minutes before it dies;
apparently SPOT-1 is not ready to "die" yet. OSCAR users should not be
dismayed by this delay; launch delays have always been a part of every AMSAT
OSCAR satellite "launch campaign." OSCAR satellite users should use this
"extra" time to acquire either a G3RUH or TAPR PSK demodulator so that they
can have their PACSAT stations ready, and hopefully, avoid the "last minute
rush" to become operational on the MICROSATs once they are launched. AMSAT-NA
will keep you informed if there are any further changes to the launch date.

DOVE DOWNLINK FREQUENCY CHANGE

HR AMSAT NEWS SERVICE BULLETIN 139.03 FROM AMSAT HQ
SILVER SPRING, MD MAY 20, 1989

TO ALL RADIO AMATEURS BT

DOVE MICROSAT Downlink Frequency Changed To 145.825 MHz

With the "impending" re-entry of UOSAT-OSCAR-9 (UO-9) predicted to occur in October, BRAMSAT President, Dr. Junior de Castro (PY2BJO) has made a decision to move the Digital Orbiting Voice Encoder (DOVE) downlink frequency to 145.825 MHz. Many satellite users will recognize this frequency as the same one in which UO-9 and UO-11 use for their voice "downlinks." Originally DOVE was designed to use 145.970 MHz as its voice downlink frequency. However, after consultation with AMSAT officials, a decision was made to change it to 145.825 MHz in order to maintain "commonality" with previous amateur radio "scientific and educational" amateur radio satellites, that is, UO-9 and UO-11. Also, it was pointed out that many schools had previously accquired simple FM receivers which were crystal controlled and only operated on 145.825 MHz. Therefore, it was BRAMSAT's desire to see this "commonality" maintained and so the DOVE downlink frequency was changed.

[SPECIAL NOTE: If you are an educator or radio amateur who is interested in setting up a program at a elementry school in your area using DOVE, contact Rich Ensign, N8IWJ, 421 North Military Dr., Dearborn, MI 48124 to receive your information packet.]

ARRL NATIONAL CONVENTION

HR AMSAT NEWS SERVICE BULLETIN 138.04 FROM AMSAT HQ
SILVER SPRING, MD MAY 20, 1989
TO ALL RADIO AMATEURS BT

AMSAT-NA To Operate a "All-Satellite, All-Mode" OSCAR Station (W1AW/5)

In celebration of the 75th anniversary of the founding of the American Radio Relay League, there will be a commemorative station operation under the callsign of W1AW/5 on 2-4 June, 1989. This activity will take place at the ARRL National Convention in Arlington, Texas. The hours of operation will be from 17:00 UTC on Friday, 2 June, through 18:00 UTC on Sunday, 4 June. In keeping with the convention theme "FROM SPARK...1914-1989...TO SPACE," a "deluxe" satellite station will be set up. It is the intention of the station planners to operate this station on every pass of every Amateur Radio Satellite that comes within view of Arlington, Texas during this operating period. In the case of the UOSATS, demonstrations of bulletin and telemetry capture are planned. All modes of operations will be supported from Mode A, B, J, and L.

Both AO-13 and AO-10 should be usable that weekend along with RS-10/11, FO-12, UO-9, and UO-11. Crank up your tracking programs and check your windows "of mutual visability" to Arlington, Texas, for 2-4 June,1989. For those with QT4.0 who would like to use the "mutual visibility" option, Arlington has the following location: Long=97.083W, Lat=32.750N, and Height above sea-level: 210 Meters.

Icom, Tandy, Telex-Hy Gain, KC Tracker, and other manufacturers are providing support for this event. The ARRL is providing special QSLs for this event featuring the "Spark...To Space" logo. Every amateur satellite station in the country should have one of these exceptional QSLs.

AMSAT-NA will be well represented in other ways at this convention. Forums on Microsats and Phase IV will be presented on Saturday by Doug Loughmiller, KO5I, President of AMSAT NA. Joining Doug will be AMSAT-NA VP for Engineering, Jan King (W3GEY) and Dick Jansson, WD4FAB, to discuss the Phase IV geostationary satellite design. On Sunday, Keith Berglund, WB5ZDP, will present an introductory level satellite forum. Also on Sunday, Bill Tynan, W3XO, will give a forum on the Shuttle Amateur Radio Experiment (SAREX).

If you are coming to the convention, please stop by the AMSAT Booth or the Commemorative station to meet the many AMSAT volunteers who will be present. If you would like to volunteer your operating assistance for the Commemorative Station, please contact Keith Pugh, W5IU, at (817) 292-5633.

Last but not least. A full size model of the AMSAT-NA PHASE IV project will be on display in the convention lobby for all interested parties to see. It will be hard to miss since it is approximently 8 ft. in diameter and was constructed by students from the Center of Aerospace Technology (CAST) from Weber State College in Ogden, UT. "See you on any of the birds during the weekend of 2-4 June, 1989."

OSCAR SATELLITES NEED YOU!

HR AMSAT NEWS SERVICE BULLETIN 139.05 FROM AMSAT HQ
SILVER SPRING, MD MAY 20, 1989
TO ALL RADIO AMATEURS BT

All OSCAR Enthusiasts Are Asked To Support The Amateur Satellite Program

This year will be a "banner" year with the launch of six, or perhaps seven amateur radio satellites. Almost every international AMSAT organization is involved in a major satellite construction effort. As radio amateurs know world-wide, amateur satellites are universal -- they are open to anyone who wishes to use them. With this unprecedented period of OSCAR construction currently happening, all AMSAT organizations need your help and support. Please try to remember the next time you hear your signal coming back from an OSCAR the literally thousands of hours of labor freely volunteered by AMSAT volunteers. In short, OSCARS satellites need your support.

AMSAT SHORT BURSTS

HR AMSAT NEWS SERVICE BULLETIN 139.06 FROM AMSAT HQ
SILVER SPRING, MD MAY 20, 1989
TO ALL RADIO AMATEURS BT

AMSAT Short Bursts

AMSAT is seeking additional Area Coordinators throughout North America. These additional members of the Field Operations organization are needed to support the expected inrush of activity and excitement centered about the launch of an additional six or seven amateur radio satellites this year. AMSAT-NA is seeking those who wish to promote the Amateur Radio Satellite program, and primarily, those experienced satellite users who will serve as "Elmers" for aspiring satellite enthusiasts. If you are interested in joining this team of "make it happen" amateurs, contact the AMSAT VP of Field Operations:

Jack Crabtree, AA0P
4327 W. Bellewood Dr.
Littleton, CO 80123
(303) 795-7736

Many AO-13 users are unaware that there is an AMSAT Operations Net which is conducted on AO-13 several times each month to help answer questions about OSCAR satellites and to provide information about the many exciting things going on in AMSAT. The following is a list of the times for the Ops Net. Please place this list in a convenient place in your OSCAR station so that you won't miss out on this interesting net which is offered as a service to all AMSAT members.

Here is the Ops Net schedule through June:

Date UTC orb-phs NCS

21 May 0200 716-188 (20 May local)
28 May 0200 731-105 (27 May local)
04 Jun 0300 746-045 (03 Jun local)
11 Jun 0000 760-152 (10 Jun local)
18 Jun 0100 775-092 W0RPK (17 Jun local)
25 Jun 0300 790-055 (24 Jun local)

Nets can be held on B or JL, but if the AO-13 satellite schedule is changed such that the Ops Net falls during an "off" period, it will be rescheduled. Frequencies are 145.950 MHz up and 435.970 MHz up. All these are for AO-13, but AO-10 is sometimes used, when available.

The following is the operating schedule for FO-12 for the rest of the month of May and for June:

DATE MODE OPERATING PERIOD
05/21/89 JD 03:11 UTC until 11:23 UTC
05/24/89 JD 08:41 UTC until 01:37 UTC on 05/25/89
05/28/89 JD 00:56 UTC until 09:08 UTC
06/03/89 JD 05:46 UTC until 00:44 UTC on 06/04/89
06/09/89 JA 04:25 UTC until 21:20 UTC
06/21/89 JA 01:43 UTC until 18:38 UTC
06/24/89 JA 01:03 UTC until 17:58 UTC
06/29/89 JA 00:35 UTC until 15:29 UTC

de DB2OS 01May89: *** AO-10 TRANSPONDER SCHEDULE ***
01May89 to 13Jul89

Mode-B : from MA 025 to MA 225
OFF : from MA 226 to MA 024

All radio amateurs who live in the Northern California area are reminded of the "Shasta SpaceCon '89" which will be held in Weed, CA on June 17th at the Student Center of the College of the Siskiyous. This all day seminar is designed to be a "beginners introduction" OSCAR satellites. Many excellent speakers from AMSAT and Project OSCAR will be present. For more information about this fine seminar, please contact Bob Dalleske, W6AMW, at (916) 964-3154.

Source record: 18752

I don't think sweep tube amplifiers are necessarily a bad thing, if properly designed. Most of these "CB" amplifiers give sweep tubes a bad name because they are typically tuned for maximum smoke and have poorly designed pi tank networks. At least this particular amplifier does - no dip in plate current because the TUNE cap is too small.

According to DeMaw, W1FB, in QST 2/80, you can make a sweep tube amplifier that develops 1KW input, because they have a 300W intermittent dissipation spec. He warns that FM, AM, and CW could easily exceed the continuous power ratings (30W), so some caution is needed. The second and third harmonics are way down, on the order of 30dB, so it is possible to make one that works well.

The biggest difficulty I've found so far is in designing a proper tank with the parts that came with the amplifier. Because sweep tubes can only take about 1000V, the plate resistance is very low - on the order of 500 ohms for 1KW dc input. This requires larger TUNE caps than the other classic designs, say using a 3-500Z at 3KV. The real problem is that 500 ohms falls in the never-never land between the high impedance matching networks used for tubes and the low impedance networks used for transistors, so finding pre-designed networks is difficult.

Another problem appears to be designing around the high combined plate and cathode capacitances. It isn't particularly difficult, although the sweep tube doesn't work well at VHF because of this.

On the other topic (using 3CX250Bs):

Where is a cheap source for sockets and chimneys ? I looked in the AES catalog and nearly fainted when I saw the prices. The socket and chimney costs as much as the tube !

>
> Edgie, WA6VZZ

General comment on crystals:

Generalization: in my experience, 99% of "bad" crystals
aren't really bad, they just are near the edge of their spec
and won't work in that particular oscillator circuit. I've
never seen a crystal go truly dead (*NO* activity) short of
being dropped on the floor (and then you can shake it and
hear the pieces rattling around).

Before replacing a difficult to obtain crystal, try fiddling
with the circuit, especially the capacitor from the base to
the emitter, and also the capacitor from the collector to
the emitter. Also, try increasing the transistor bias current.

Sometimes this will also fix a circuit which goes out of
oscillation when you attempt to tune it to frequency.

Hope that helps

N6RK

I've tried the two antennas instead of a duplexer technique before and got nothing but grief. It is difficult to maintain the required isolation and the differing antenna positions tends to compromise the coverage. (The coverage is usually not balanced on transmit and receive.) Other people have related similar problems to me. I would suggest coughing up the money for a good duplexor instead.

Anyone out there in netland have any better luck with the two-antenna solution?

I have a Uniden 760 which I am happy with. I have used it at home with the short whip antenna and with an external antenna on the roof. I also run it mobile. Although I am located at a fairly high elevation and am exposed to alot of RF, I have not experienced any intermod problems. I am sure that they exist in the design as the other folks have stated. There is one image frequency that gives me a problem -- a local ham repeater shows up on a forest service frequency.

You can correctly quibble with the absolute performance of the radio, but for the $240 that I have invested in it, I am pleased with its capability. I have several friends who own one or two of them and they would provide similar opinions.

Hi
This may sound real strange..... but when I was in the business I have done the following:
Remove covers on electronic device and throw the whole mess into the dish washer. Be careful not to use too much soap (about 1/10th the normal dose and it should be fresh, old soap (Cascade) will leave grit) don't have other dishes in the washer.
Run a normal wash cycle with the "power drying" feature turned off or catch the washer at the end of the last rinse and remove the electronic device. Place the device in front of a fan with a large amount of air volume and let the device blow dry at room temperature for 24 hours befor using.

Yes it is sometimes radical to go to this length but it seldom does any harm to anything.

Have fun and soapy 73's

The best way to clean electronics gear of smoke gunk and residue (and
this includes burnt building smoke) is with a combination of Denatured
alchohol, 409 (Swipe or Fantastic) and Windex (Not Windolene you Gs). Use
clean rags, paper towels and "Q-Tips" (Cotton Buds) to transport the fluids.

Really greasy sticky stuff should first be approached with denatured
alchohol (High proof Vodka, white litnin', or methylated spirits). Be
careful with the alchohol, it can disolve some cheapo silk screened labels.
This will disolve most greasy smoke residue. Then approach the whole thing
with tons of 409 and lots of rags. You can then wipe over with clean water
or finish off with the spray Windex.

The further you can disassemble the unit before cleaning the better. PC
boards etc that are gooped can be sprayed with alchohol on site, or taken to
a facility with post soldering resin removal cleaning tanks (EEK! there goes
the ozone layer!). Wash the boards in the tank - some parts may need removal
from the board first. But a spray bottle with your local equiv of Stolichnya
does a good job.

Also dont forget to clean line cords, connectors etc. Use lotsa Q-Tips
in those crevaces. I have used this routine on equipment salvaged from fires
and also to clean my own gear when I was sucking down 20 Gouloise Disque
Bleu per day.

If you don't have access to 409 or its equivelant, you can make up a
solution of industrial detergent (Shell Telpol) water and denatured
alchohol.

When you have finished, the rig should smell faintly of soap and look
like new. If there is an odour residue, it's because you have not removed
all the smoke residue from behind knobs, panels, pcbs, line cords etc.

Yours

>
> trackside devices called automatic defect detectors or hotbox
> detectors. These apparently examine passing trains for hotboxes and
> other problems and then, using a voice synthesizer, transmit a report
> to the train crew over radio.
> Does anyone know of any of these devices (and the radio frequencies
> they use) in the Boston and Worcester (MA) areas?

I used to hear these when I was going to school in San Luis Obispo, California. There is quite a climb for the Southern Pacific there called Cuesta Grade. I guess the detectors were somewhere around that grade. I was hearing them on SP's road frequency around there on 161.55 MHz (NBFM). They would say something like "S-P Milepost two-one-seven (short pause), no defects, no defects" in a female voice.

You might try searching the range 160 - 161.6 MHz for active railroading frequencies in your area. This range covers about 95% of railroad radio traffic and I think those automatic detector units broadcast on one of the normal railroad frequencies for the railroad(s) they serve.

> Fred J. Stellabotte - N2JCD

I don't have an MFJ filter, but I do have an MFJ RTTY demodulator.
I opened the box once to look inside and discovered that the PC
board had been etched almost to death. About a dozen traces had
been patched with wires, and many others looked like they
were about ready to fall off. They didn't even epoxy down the patch
wires! Any company that would allow something like this to go out
the door will never sell anything to me again.

Mark,

Although I have implemented the calculations you refer to, I don't know of any actual references. A good textbook on trigonometry and analytic geometry would be helpful.

The operations are pretty straightforward, even if you need a computer to make them practical. The "bahn" coordinates refer to the orientation of the spacecraft spin axis (and antennas) with respect to the orbit plane. ("Bahn" is the German word for "path".) They are generally given in polar coordinates, i.e., "bahn latitude" and "bahn longitude". Longitude is in the plane of the orbit, latitude is perpendicular to it.

Originally, the zero-zero reference direction was to be defined by the geocentric spacecraft position vector at perigee. Given the Phase III design, this would be the ideal orientation for the spacecraft since it would place the earth in the center of the antenna pattern at apogee.

Unfortunately, both AO-10 and AO-13 spin in the opposite direction to the original plan (AO-10 by accident, AO-13 because it was carried upside down on the launcher). Instead of changing a few signs in the onboard software, the author chose instead to invert the entire spacecraft coordinate system, which has caused no end of confusion to everyone. So the nominal antenna orientation is longitude 180 degrees, latitude 0. (He also expresses angles in units of 256ths of a circle, again causing considerable confusion. But I digress...)

Anyway, to find the angle at which you see the spacecraft antennas, you first compute the 3-D cartesian position vectors of the observer and spacecraft in the earth-centered coordinate system (where the XY plane contains the equator, and the Z axis contains the earth's rotation axis). Subtract the observer position vector from the spacecraft position vector; this gives you your "look vector" (vector from observer to spacecraft).

Now take the orientation of the spacecraft's spin axis in the "bahn" coordinate system. Using the inclination and RAAN figures from the Keplerian orbital elements, rotate this vector into the earth-centered coordinate system. Find the angle between this vector and the look vector computed above (use the dot product operator) and you have your antenna aspect angle.

If you have a sun model (a subroutine that gives the vector position of the sun as a function of time) you can do similar vector operations to compute the sun angle on the satellite, determine whether the satellite is in eclipse, find out if it's dark outside without looking out the window, etc.

Date: 1989-05-24 07:14:05 UTC
From: bote@csense.UUCP
Message-ID: <247@csense.UUCP>
Source record: 18767

From article <178@lazlo.UUCP>, by cep@lazlo.UUCP (Christopher E. Piggott):
> My two questions are:
> (1) What is the relationship between spacing and isolation
> if we do BOTH - i.e. 300' horizontal and 40' vertical?
> I don't really believe that 60db from the horizontal
> plus 60db from the vertical would add up to 120db
> total isolation - but I don't really know!
> (2) We are planning on using Ringo Ranger II's. I don't
> understand the relationship that the 7db gain
> the Ringo Ranger has will do to the isolation
> figures

1. It is much easier to achieve vertical isolation, say on a tower,
for your purposes than to achieve horizontal separation.
There are still near-field effects which may cause
duplex noise if you have any rust on the tower, but
they will most likely be less than if you duplex
on one antenna. Put the receive antenna way up high
and mount the transmit antenna a good ways below it.
As soon as the two antennas are no longer aligned
in the same vertical line, their fields will begin
to interact much more and drastically reduce the
effectiveness of vertical separation. If you really
must have horizontal separation, do it right and
get a mile or so between them with a phone line
or RF link-another expense and a big maintanence
headache!

2. A Ringo Ranger?! After you find a real antenna, the gain
figures for it will indicate how much it compresses
the standard 'figure 8' dipole pattern down into
an elliptical pattern; that is where 'gain' comes
from. It is gain referenced to another antenna's
pattern. Since a high gain vertical dipole array
squeezes the pattern in the vertical plane such
that it is much weaker off the horizon, it has the
effect of extending the reach of the pattern out
toward the horizon, much like squeezing a round
balloon until it takes the shape of a bullet.

I find vertical dipoles are the way to go. If they require
repair, the wiring harness is usually the culprit and
is usually accessible externally. If the elements bolt
on to the mast with clamps or similar fasteners, it is
a relatively simple job to tighten them; these are the

two biggest sources of noise on these antennas. Plus
you get a free DC ground with every one!

999. Another (and tougher) law against listening ?

Newsgroup: rec.ham-radio
Date: 1989-05-24 07:26:28 UTC
From: die@cpoint.UUCP
Message-ID: <2297@cpoint.UUCP>
Source record: 18768
Cross-posted to: rec.ham-radio,rec.video

I have been casually following the technical side of the war between the pirates and the satellite/cable interests over the last three years with an eye toward its implications for the design of other security systems.

Toward this end I recently subscribed to one of the underground rags "Satellite Watch Newsletter" published by Resort Publishing Company in Hot Springs AR. This publication chronicles a deadly serious war between the FCC, FBI and pirates with hundreds of felony arrests and confiscations of both equipment and financial assets. Having no other connection with this underworld I have little idea of the accuracy of these reports; however, one item mentioned warrents note by those on the net who merely listen to or study radio signals (rather than deliberately stealing encrypted cable TV services for which there is a clear mechanism of payment and subscription).

In the May issue Sat Watch makes a somewhat hysterical mention of a change to Title 14 section 605 (which I believe is the Goldwater satellite viewing law passed in 1984 or 85 rather than the more traditional "section 605" which I think is now 705?) and title 18 section 2512 (part of the ECPA ?). The article says (qouted in part without permission):

"On January 1st. 1989, Title 14, Section 605 and Title 18 section 2512 of the Communications Act of 1984 (sic) were amended making it a felony to attempt or to assist others to attempt to monitor unauthorized signals over the public airways. The penalties for this 'crime' (sic) include seizure of assets, fines of up to $600,000 and imprisonment. According to the FCC, a person does not actually have to monitor the airways to be charged with a crime - the mere knowlage or possession of tools that could be used to monitor the airways is sufficient evidence to issue a search and seizure warrent. (Agents have seized soldering irons.)"

"While the intent of the law was to prevent unauthorized reception of pay TV signals that are transmitted over the public airways, the broad language makes it a crime to monitor any signal (scrambled or not) that one has not been specifically authorized to receive. This includes commercially supported stations that are legally viewed via VHF or UHF, but are illegal to view via microwave (PBS, C-Span, and AFRTS) fall into this catagory (sic)."

[I thought that C-Span was open to all and entirely legal to watch]
(Material about cable "monopoly" and press corruption omited).

"Probably the most frightening aspect of this entire situation is the effort big government is taking to enforce the new law

restricting monitoring of the public airways. In a time when
our country is racked with violent crime, our government is
allocating tremendous resources (more than 10% of the total
FBI force, plus hundreds of other federal agents) (sic) to prevent
private citizens from monitoring the public airways in the
privacy of their homes."

..... (more omited)

Does anybody know anything about this change to the law ?

What are its implications? The ECPA was a bit vague, but "not
specifically authorized" goes well beyond the ECPA and would seem
to restrict legal radio listening to CB, ham-radio, GMRS, the public part
of broadcast signals and very little else as those are the only
signals for which specific authority is granted in the ECPA. (The
other types of signals such as aircraft, marine and police and government
mentioned in the ECPA are not exactly authorized, as I read the language, but
merely not specifically defined as private).

If anything like 10% of the FBI is being devoted to stamping out
RF signal piracy then it is very clear that someone in government at
a pretty high level has some very different priorities than the
attitude expressed in 1985 (about ECPA) of "we won't seriously try to enforce
this", and "Section 605 is enough .. we don't need more". It is indeed
interesting that so little about this effort has gotten into the media.

On the other hand it is amazing that of the more than 1.5 million
(figures from newsletter) Videociphers sold, only 400,000 have ever
been authorized. This implies that there are at least a million pirate
TVRO systems out there, and at an average price of $300-400 for modification
over the $350 retail price of a Videocipher, there has been real money in
the TV piracy business. I suppose that an illegal enterprise of that scale
might well attract serious federal law enforcement attention.

It is also amazing that a million relatively upscale families able to
pay $1500-2000 for a TVRO system (and to own a site on which to put a dish)
are perfectly willing to steal cable service that other people pay for. This
reflects the sort of society in which we live, I guess. (Perhaps it also
reflects the sort of people who bought TVRO systems in the first place with
the rights to use the signals so ambiguous.)

Does anyone know whether the current FCC/FBI crackdown is motivated
by the $500 million scale of the cable TV signal piracy problem or reflects a
broader federal determination to aggressively enforce the view that the right to
passively and privately receive a radio signal is a privilage granted by the
transmitting party rather than a natural right having its origin in the laws of
physics and common sense ?

In any case I guess the quiet hobby of passively listening to the radio
out of curiousity and for no particular economic gain, except perhaps that gain
that stems from sharpening one's technical skills, is now largely illegal
and soon perhaps to become an aggressively prosecuted offense. Back in

1978-1979 when Bob Cooper and friends started to publicize the possibilities of intercepting microwave signals from satellites and exploiting them to obtain free cable programming, I thought that I saw the end of this quiet little hobby of high tech signal exploration for the technical elite. And alas that day of reckoning is here. I've often wondered if by founding a large scale industry fuelled by signal piracy they accellerated the inevitable process of locking up the spectrum or slowed it down. If they hadn't created the TVRO business would the 1989 law still be the old gentleman's section 605 that didn't quite make it explicitly illegal to intercept signals in the privacy of one's home if there was no obvious economic benefit or disclosure ? Or would scanners and cellular phones have done it anyway ?

I suppose this all has to do with the emerging concept of information as property. In a society in which there are increasingly complex, arbitrary, and unenforcable rules and laws as to what we can do with information in the abstract divorced from any particular physical embodiment it makes as much sense for it to be illegal for me to interpret the electromagnetic energy in my back yard as does to forbid me from using a pattern of bits on two computers at once if I have only paid for the right to use it on one. And the increasingly obvious fact that there is no way that most forms of electronic information (such as the bits on a program floppy or a CD) can be protected except by social compact makes it just as sensible to rule that information broadcast for all to see is private property and owned and controlled by the source.

It was fun while it lasted.

I used to clean 450 MHz Pre-prog radios by spraying them with 409 until the grease ran free, then spraying them with the high-pressure garden hose, and finally finishing up with a run through the dishwasher, except for the drying cycle. A final rinse with distilled water and then dry it in the oven on as low as it'll go with the door cracked open to let the steam out.

Uh, take the tube shields off first, unless you like dirty tubes. Or take the tubes out and wash them separately.

It was often necessary to shoot a little talcum powder into the coil forms to keep the ferrite slugs from getting stuck to the wax, but I never had a problem with the radio being damaged by this kind of treatment.

This worked on Motorola 140D and T44 radios too, but the T44s had many more incidents of frozen coil slugs. The cure was simple: you ran an electric drill down the middle of the coil form to crunch up the slug, blast the pieces out with compressed air, shoot some talcum powder into the form, and thread a replacement slug in.

If you've never worked in commercial two-way, you have no idea how dirty the inside of a radio can get when it's mounted under the hood of a tow truck.

Don't do this to rice rockets. They won't survive.

I was looking at a Motorola "Voice Reporter" radio just the other day.

It's a two-watt highband VHF (130-175 MHz) transceiver with a voice synthesizer, Quik-Call, singltone, and touch-tone encoders in it. There is a microprocessor and an installer-programmed EPROM. The unit can monitor 4 or more alarm conditions, be equipped with battery backup and/or solar power, and will report alarm conditions by keying on the transmitter and sending a programmed phrase, an indentification sequence, and the alarm status. Apparently they are often sold with temperature, pressure, voltage, and intrusion sensors. The radio's receiver is used to ensure that only one reports at a time.

The unit is ordinarily housed in a NEMA-approved locking electrical box with tamper switches, and has a power supply module, the alarm controller module, backup batteries, and a modified Maxar-80 transceiver. The one I looked at was on 157.6 (I think).
I dunno what they sell for.

Has anyone been transmitting using very low power (QRPp)
lately? My homebrew 3 watt cw transmitter, made from a tape
recorder bias oscillator, is broken.

Now, my only functioning transmitter is an old tube type Globe
VFO. I've been using it on 40 meter CW to work stations during
the day when the noise level is low.

The VFO only puts out 115 milliwatts. My transmitting antenna
is nothing special -- a 132' center fed Zepp only 23' high.
A separate receiving antenna connected to Japan Radio NRD-525
allows full break-in (QSK) operation.

I have been offered a Quotrek system by my broker. This is marketed by
Lotus (I *think* the well-known software house?) and is a fixed-frequency
tuner with a dial-up keyboard. It operates autonomously with its own
antenna; here in the Bay Area, it piggy-backs off KQED on 88.5 MHz.
It provides real-time stock quotations from NY and other exchanges.

Apparently every set is issued with a unique number tied to the client's
name, making it possible for Lotus to "turn your service on or off".

I imply from this that an encoded low datarate channel has been leased,
which includes serial number data in some fashion.

Does anybody have an idea as to how this system operates?

1009. ANARC Convention Update

Newsgroup: rec.ham-radio
Date: 1989-05-25 05:21:18 UTC
From: rh@well.UUCP
Message-ID: <11833@well.UUCP>
Source record: 18537

Here's an update on plans for the ANARC convention:

ADDITIONAL PRESENTERS:

Mayin Correa will speak on "The Role of Radio in the Democratization of Panama." One of the best-known journalists in Panama, Mrs. Correa is now living in exile in the US. Her family owned an AM station in Panama City, Radio Continente, which was taken over by Noreiga's forces in 1987 to stop their reporting of civil rights violations and opposition activities. Elected to the National Assembly, she has been unable to serve because of an arrest warrant stemming from her radio reports. Mrs. Correa's reports are still aired daily on Radio Impacto in Costa Rica.

Chuck Roswell, producer of TWR's "Bonaire Wavelength," will present a slide show about broadcasting in the Caribbean, forcussing on his station.

Tom Meyer will record one of his "Happy Station" shows at the convention, for later broadcast on Radio Netherlands.

The latest broadcasters to confirm that they'll attend are Han Hee-Joo, producer of Radio Korea's DX program, and from South Africa, either the head of Radio RSA Fanus Venter, or Piet Maartins, or both.

Convention Registration is US$25, plus the hotel (US$50/night) and banquet (US$25). Join us at the Dolphin Beach Resort in St. Petersburg Beach, Florida, July 14-16. To register write to ANARC-89, P.O. Box 272301, Tampa, FL 33688 USA. See you there!

And, in article <215@bongo.UUCP> julian@bongo.UUCP (julian macassey) responds:

> Really greasy sticky stuff should first be approached with denatured
>alchohol (High proof Vodka, white litnin', or methylated spirits). Be
>careful with the alchohol, it can disolve some cheapo silk screened labels.

It can also discolor some plastics (or, at least, when I sprayed Lysol Spray
on a can opener once it made the fake wood turn whitish... My wife was not
impressed!)

>This will disolve most greasy smoke residue. Then approach the whole thing
>with tons of 409 and lots of rags. You can then wipe over with clean water
>or finish off with the spray Windex.
>
BTW, does 409 still dissolve paint? back in high school I noticed this
phenomenon while cleaning a homemade camping cabinet (I'm 35 now, so its
been quite a while). If it still likes to soften paint, then you might
want to be careful with it as well.

Another possible cleaner is TSP. Yes, I know its terrible stuff, and
can remove the top layer of paint, but it works great on silicon caulking,
so you might find it useful. Wear gloves, though. You might even want
to use gloves for some of those other detergents Julian mentioned.

(Hmmm, this probably all belongs in misc.consumers, but it started
here and I have a feeling that it is over by now, so why bother them
over there? :-).

I do the same thing and it works very well..

One caution, however...

Do not do this with any equipment that uses wax potting. Many
Japanese radios use wax to pot IF cans. The hot water will melt this
wax out.

Be sure to relube any ball or sleeve bearings (pots, tuning caps and so
on) after cleaning.

I have been looking at the communications receiver sold by Radio Shack: DX440 (PLL synthesized circuit) for $200 ($240 includes 5 years of free repairs).

I wonder how good is it for he money and, can a comparable performance be bought for less? Or, does someone else offer more performance for the same cost?

Any comment will be appreciated.

>

I take strong exception to the use of the word "pirate" to describe those who receive sattelite signals and do not pay the ransoms demanded by some stations. I also take exception to impuning the motives of these people or society.

I do not watch TV (sattelite or other) enough to care except that this is another classic example of the government and special interests teaming up to grab yet another public resource and make criminals out of ordinary citizens.

Look at the situation through other than industry double-talk. What the sattelite industry is saying is that they have the right to grab large pieces of public resources (frequency bands and geosync slots) and then have exclusive use of same.

Now, public policy has always been that these resources would be licensed for the use of licensees BUT no guarantee has ever been implied that this use is exclusive or private. A personal freedom that until recently has been inviolate has been the right to receive any radio signal that strikes one's antenna. There have been quite legitimate restrictions on the use of any information gathered from this listening.

The traditional agreement between the American public and the users of RF (licensees) has been that in return for being given the use of a shared and finite resource, the public has retained the right to receive anything broadcast using this resource.

If the satelite companies REALLY desire secure transmission, they could at any time avail themselves of wireline services just like the networks used to do (and still do in some cases). Sure it's more expensive than RF - no one said it's not.

The ECPA, of course, has changed some of the rules - at least until it is challenged in court. (THAT should be an interesting fight).

In my personal case, if I were ever to become bored to the extent of needing TV, I'd buy a satelite receiver and a modified VideoCypher despite any law to the contrary. The fine tradition of civil disobedience in this country does, after all, address just such grabs of our freedoms.

1017. Question HF<->VHF Gateway

Newsgroup: rec.ham-radio
Date: 1989-05-25 17:19:25 UTC
From: ST5631@SIUCVMB.BITNET
Message-ID: <8905270712.AA15440@ucbvax.Berkeley.EDU>
Source record: 18538

Ok, here's a new one to the net. Is it now legal to have an unattended HF<->VHF packet gateway? There has been some discussion here locally, (Southern Illinois) as to whether this is now allowed, but nobody *really* seems to know. I have got a multitude of answers, with the most common being YES, NO, and Yes if you have a special permit. I have spoken with several HF packet stations and *they* don't even seem to know. So, I got smart, or so I thought, I called the Governing body over communications, the FCC. Well, to my surprise *they* didn't even know. So here I am in a quandry wondering if it is now legal or not. I have been told that recently the rules have changed and it now is. But, if you read the June issue of QST in the article reviewing the KAM it clearly states that it is still illegal. I have run into a couple of guys that say it is if you get some sort of special permit from the FCC, but the FCC themselves didn't even know what that permit would be. If anyone out there has the *answer*, I would greatly appreciate hearing from you. I would also like the source(s) of you information.

Thanks and deeply wondering. I can be reached at any of the below addresses.

P.S. You may op to post any information to the net also. 73's de KE9KD

> I've tried the two antennas instead of a duplexer technique before
>and got nothing but grief.
...

>Anyone out there in netland have any better luck with the two-antenna
>solution?

No in fact of the dozen or so times I have been involved none have worked well enough to be worth the trouble (I include my full duplex remote base here too). The only times it DOES work is crossband - 2M to 432 or some such, or by using sites separated by more than a mile.

The one time the separate sites were used was a cable TV receiving location and they were adamant about NO transmitters (the link was landline). It worked, but the coverage was very strange. We ended up using the remote as an auxiliary receiver with a fairly high powered/low sensitivity setup on the mountaintop (together with almost giga-watt ERP from TV, FM broadcast etc). The transmit site was about 200 yards across with almost 50 transmitters including 5 TV channels, intermod was unbelievable!

In this case the remote receiver worked well for weak/dx signals and the mountian top receiver worked well for "downtown" fill in coverage. I think they ended up with the local receiver having priority though. Not a simple set up and the chief engineer for one of the FM stations was club trustee!

Get a duplexor!

1020. NEW! SWL bitnet mailing list, Subscription info:

Newsgroup: rec.ham-radio
Date: 1989-05-25 20:39:35 UTC
From: kingdon@cunixc.cc.columbia.edu
Message-ID: <1552@cunixc.cc.columbia.edu>
Source record: 18541
Cross-posted to: rec.ham-radio,rec.ham-radio.packet

ALL ARE INVITED TO JOIN A
>>>>>NEW SHORT WAVE LISTENERS ELECTRONIC MAILING LIST<<<<<

WHAT IS SWL-L?

Now there is a medium which SWLers can use to trade information on:

o Frequency lists (for all modes, all frequencies)
o Projects (homebrew, from simple to complex)
o Ask questions about:
o Monitoring
o Radios
o Antennas
o Listening conditions
o RFI
o etc.
o Learning!

I have been reading rec.ham-radio(.packet/INFO-HAMS) for 3 years.
While I have learned a great deal from reading this list, I feel it is
important to the SWLing community to have its "own place." There have been
some SWL related articles, which are welcomed by these Ham forums, yet I
have not found a dedicated SWL related information base.

Now, there exists such a medium here. There is a new listener's
group set up via LISTSERV here at Columbia University

Now SWLers can subscribe to a list which will be mailed to them
which will contain items of interest including, but not limited to the above
topic areas. You can receive frequencies FAST. How would you like to find
out the utility frequencies for an emergency situation within hours (not
days like it takes some Usenet messages to be sent and replied to via the
net, or MONTHS for magazines!). How about talking about projects you are
working on, antennas or radio problems? Many, many issues can be discussed.
I hope you will subscribe to the list, and if you do PLEASE POST!

HOW DO I GET ON THE LIST?

Just like any Bitnet listserver list you may subscribe to the SWL-L
list here at Columbia University.

INSTRUCTIONS:
1) if you're sending from a BITNET node, you can say:
(CMS) tell listserv at cuvmb subscribe swl-l your name here
(VMS) send listserv@cuvmb subscribe swl-l your name here

2) if you're sending from an internet site, or a UUCP site, do the
following:
a) send a letter to listserv@cuvmb.cc.columbia.edu -or-
rutgers!columbia!cuvmb.cc.columbia.edu!listserv
b) the first line of the body of the letter should read:
subscribe swl-l your names here.

3) You will receive a letter of confirmation. In this letter you
will find out more information about listservers and bitnet file servers.

4) To post to the list send mail to SWL-L@cuvmb with your subject
and letter. This letter will be echoed to all members of the List.

5) There is also a file server availiable. You may get a listing of
the files in the file server (currently there are none) by sending a command
to listserv (addressed in the same manner as you used to sign on the list).
The command will be the body of the letter. The command for a directory
listing is:
get swl-l filelist
You may request a specific file by sending a command (to listserv) which
says:
get filename filetype
as listed in the filelist.

REMEMBER!
----
send COMMANDS to Listserv@cuvmb
send LETTERS to SWL-L@cuvmb

Sign up and have fun!

1021. Mods for BC200/205XLT

Newsgroup: rec.ham-radio
Date: 1989-05-26 12:51:34 UTC
From: PETE_SIMPSON@DGC.MCEO.DG.COM
Message-ID: <8905261351.AC00045@adam.DG.COM>
Source record: 18545

CEO file contents:

The following was received from Grove Enterprises with my friend's BC200XLT.

.....

BC200/205XLT CELLULAR RESTORATION

Note: It is unlawful to monitor cellular telephone conversations. It is possible to monitor signals from the deleted ranges even without conversion. Simply add 21.7 MHz to the deleted frequency and enter the higher (image) frequency. Reception is virtually identical in strength to that which would be heard on the deleted frequency.

The frequencies deleted at the factory may be restored, but the procedure must not be attempted by anyone unfamiliar with electronic circuitry. Grove Enterprises assumes no liability for damage caused by this procedure. The modification will void your warranty.

TOOLS REQUIRED: Small Phillips screwdriver, small wire cutters.

1. Slide off the battery pack and remove the antenna from the scanner.

2. Using a small Phillips screwdriver, remove the two screws from the back of the scanner, the two screws which hold the battery retaining spring at the base and the spring itself.

3. Carefully pry the bottom of the rear cover from the radio and remove the cover.

4. Locate the two small screws at the base of the circuit board and remove them. Gently pull the front panel from the mainframe at the base and separate them.

5. Locate the (64 pin quad flatpack) microprocessor IC labelled "UNIDEN UC-1147" and the 10k ohm (brown-black-orange) leadless resistor positioned above the letters "DEN" on the IC.

6. Using miniature wire cutters, cut the resistor body in two without disturbing anything else near it. If the left solder pad comes loose, it may be peeled from the board. Brush or blow away any residue. This completes the restoration.

REASSEMBLY

7. Insert the top of the front panel into the slot under the volume/squelch control panel and, noting carefully the alignment of the dual inline connector at the bottom of the board with the mating socket, press the

front panel firmly into place. Be sure that the holes at the bottom of the circuit board line up with the holes in the plastic standoffs below them. Insert the two screws and gently tighten them.

8. Replace the back cover by inserting the top of the cover into the slot under the volume/squelch control panel; press the cover into place, insert and tighten the screws.

9. Reposition the battery retaining spring (slotted side toward notched hole), insert the two remaining screws and gently but securely tighten them.

10. Slide the battery pack into place; switch the scanner on to make sure the display comes on. If not, the battery is discharged or the dual-inline connector was misaligned during assembly (see step 7).

Assuming the display comes on, press: MANUAL, 845.0, E; within two seconds, the frequency 845.000 should appear on the display.

Cut this resistor

I see a parallel between the right to own and operate radio receivers and the right to own and operate firearms. If government starts taking away some of that right by restricting the type of radio reception allowed ON ONE'S OWN PROPERTY, haven't they already tried and succeeded to some extent with Americans' firearms? A big difference is the zeal of the NRA vs. the ARRL. Maybe the NRA is a bit vehement at times, but it would be good to see more of that mentality in the ARRL.

Since these commercial entities are braodcasting on my premises, in the true sense of liberty I believe I should have freedom to receive any of it. They have the responsibility to scramble or otherwise encode their stuff if necessary, since they are the origination point.

I was amazed several years ago to learn that government was even contemplating laws against this liberty. Now it sounds like they've taken a second more active step by confiscating "illegal" receivers and other gear, e.g., soldering irons, etc. If true, this is a very grave situation. I watched a movie called The Hiding Place, about Corrie ten Boom in Holland during World War Two, and one of the first things the NAZIs did after occupation was confiscate all radios.

Bob,

>Has anyone been transmitting using very low power (QRPp)
>lately? My homebrew 3 watt cw transmitter, made from a tape
>recorder bias oscillator, is broken.

I run a lot less than this on 10368 MHz SSB, but I don't think
that is what you meant....

>Now, my only functioning transmitter is an old tube type Globe
>VFO. I've been using it on 40 meter CW to work stations during
>the day when the noise level is low.

Where's my VF-1 when I need it?

>The VFO only puts out 115 milliwatts. My transmitting antenna
>is nothing special -- a 132' center fed Zepp only 23' high.
^--------
!
Now the real point of this reply. This is what I
called the antenna I first used as a novice too.
Since then I have seen it called a "Windom". Isn't
center-fed Zepp oxymoronic? I thought Zepp referred
to the antenna for a Zeppelin which was a trailing
dipole fed at the end? I'm not trying to be picky,
I just always wondered.

Any radio that operates in the marine band must be FCC TYPE APPROVED. You can
buy a commerical radio and operate in the ham bands and marine bands (some
of the ICOM commerical radios may have the freq range) but use of your ham
2 Meter rig in the marine bands is illegal, except under emergency conditions.
If you are nabbed using it there you could loose your ham ticket as well
as any other licenses (radio) you may hold.

I figure that if companies continue to transmit their RF through
MY BODY that I have a natural right to intercept that transmission.
Same goes for radar detectors (if you want an undetectable speed measuring
device, use VASCAR!).
I would like to see a good legal test of the anti-interecpt laws.
I understand the electronics manufacturers problems, but just because
an industry can benfit from unethical laws doesn't mean we have to
pass them.

I would appreciate hearing any information people have about radioteletype broadcasts of weather reports and forecasts.

If I receive e-mail responses, I will post a summary. Thanks.

1031. Needed: Regency HR2A Schematic

Newsgroup: rec.ham-radio
Date: 1989-05-26 19:11:50 UTC
From: ST5631@SIUCVMB.BITNET
Message-ID: <8905270714.AA15505@ucbvax.Berkeley.EDU>
Source record: 18559

Well, as long as the trend seems to be needing schematics, here's one for everyone. The Southern Illinois University Amateur Radio Club is looking for a schematic for an old HR2A. We have intentions of putting this thing on the air as a dedicated 24 hour node. If anyone would happen to have a schematic for this beast, I would appreciate knowing so. We would be more than happy to pay for a copy, shipping, FAX, or any other charges that might apply. Thanks so much in advance. And hope to see ya on the air. 73's.

P.S. For someone that doesn't even care for packet, it is almost humorous that I am posting this. :-) 73's.

The "HOSS TRADERS" Ham Radio and Electronics flea market will take
place June 2 and 3 at the Deerfield Fairgrounds, RT-43 Deerfield N.H.
Doors open at 4 P.M. Friday afternoon for early deals and camping. The
doors stay open all night for late arrivals. The major activity starts
saturday morning at dawn.
This marks the return of the flea market to Deerfield after a two
year absence.

+
+Has anyone been transmitting using very low power (QRPp)
+lately? My homebrew 3 watt cw transmitter, made from a tape
+recorder bias oscillator, is broken.
+

I've had exellent luck using the AEA DX Handy on 10 meters. I built up a backpack kit that includes:

o 15"x12" 15vdc @ .450 AHr Solar Array, output terminated in a cheap cigarette lighter plug.

o 4 AHr Nicor 'Lil Nic' Nicad pack (normally used for portable VCRs)

o (believe it or not!) Radio Shack power-adapter (12->9vdc) This has a cigarette-lighter plug input and a series of output adapters.

o Also from the above source, a y-harness for cigarette lighter plug.

o Speedex straight key on a hardwood base, with a SPDT for the Tx CTL

o Cheapo-homebrew 10 m. 1/4 wave dipole using rg174 and some plastic insulators and some light nylon cord with battery charger-sized aligator-clips.

o A low-buck($3.50 @ discounter) CALRAD-brand high impedance (50K Ohm) hand mic. w/ coil cord.

o Some usual 'stuff': pliers, screwdriver, knife, duct-tape, etc.

Using this setup I've made over 100 contacts during peak conditions on 10 m. Both CW and SSB. The output is only 2w PEP and the receiver, although sensitive, is somewhat limited by the telescopic whip. The dipole fixes that! ..and it can be erected in either plane of polarization for best effect.

I added 4 spots of thin rubber pad to the back of the unit's case, this gives it some "feet" and helps prevent skidding across picnic tables. The only real bummer about this toy is that the VXO has such a limited range, (50KHz per xtal) and if you DO change xtals, you must retune the various stages for peak performance. Mine came with 28.2-28.25, and 28.3-28.35 as the CW and SSB ranges. Hey, it works! And it is EZ..and people freak when they do hear you!

73 for now,

1034. Chinese Jamming of the V.O.A.

Newsgroup: rec.ham-radio
Date: 1989-05-26 19:52:53 UTC
From: dong@brauer.harvard.edu
Message-ID: <1950@husc6.harvard.edu>
Source record: 18555

In the program Media Network on Radio Netherland at 00:30 UTC may 26, the host Johnathan Marks gave more details about the recent Chinese jamming of the V.O.A.'s Chinese program.

Johnathan called the director of the V.O.A. Richard W Carlson at Washington D.C. Mr.Carlson claimed that they first detected the interference on Monday and they had pinpointed the location of the jammers. It is in the southern part of China, just outside of Canton [Guang Zhou]. Three of five of their frequencies were jammed and they were not sure if the other two were also jammed, at least they had not detected from their monitoring posts. Mr.Carlson said that they had also detected jamming to the B.B.C.'s Chinese transmission from Hong Kong on Monday night and they notified the B.B.C. immediately. The jamming on B.B.C. was not found the next day.

Johnathan Marks gave the frequencies for V.O.A. Chinese program at 22:00 UTC on 15395, 9545, 7200. [Some of them should be audible in North America.]

Mr.Carlson said that because of the jamming, the V.O.A. had started it's 1 megawatt MV transmitter in the Philippines to China. He didn't give the frequency.

Mr.Carlson claimed that the director of Radio Beijing [Ms Yilan Ding?] had a very good personal relationship with him. The director and 10 of her followers had dinner at Mr.Carlson's home a few weeks ago.

At the end of Media Network, Johnathan called Mike Bird of Radio Australia at Melbourne. Mr.Bird told him that Radio Australia's Chinese program has also been jammed.

Apparently, Deutsche Welle and Radio Moscow's Chinese programs have not been affected.

[Can somebody on the west coast start to monitor the Chinese domestic stations on shortwave and post the news to the net? It is hard to do it here in the northeast. I am also looking for the complete schedule for the V.O.A.'s Chinese program. I mean something more current than the 1989 WRTH.]

I agree!!!

If you put in my house, or yard, it is mine.

If someone dumps their trash in my yard I have to clean it up!

If someone's dog doo-doos in my yard I have to clean it up!

If someone throughs toxic waste in my dumpster I am legally liable for
its disposal.

So, if you put in my house, or yard, it is mine, unless it has value?
I believe, if I have to pay for the bad stuff shouldn't the good stuff
be mine? If I were to toss a hundred dollar bill in your yard and leave
it, do you have the right to take it?

If I tossed a trash bag in your house, could you sue me? Therefore, can
we sue HBO to stop broadcasting into my home? After all, I can't have my
children watching that smut! I mean there must be at least 47 breasts in
that last show:-)

If HBO doesn't want me to watch their broadcast, encrypt it. If
their encryption method is not any good, change it. If that is to costly
keep it out of my home! I don't leave my money in their house.

thank you,
James D. Corder

RUSSIAN PHRASES FOR AMATEUR RADIO

Thanks for the tremendous response to W6HJK's book on Russian Phrases
for Amateur Radio. In the last few days, Len has received about 400
requests for this free book. The plan was to make this self-sustaining
through contributions. If you liked the book, you were invited to
contribute whatever you felt comfortable giving. Unfortunately, the
unexpected rush of requests has put a kink in the cash flow. If you
are planning to send for this book, or have already done so, a small
contribution "up front" would really help Len in his effort.

Requests should be sent to:

1037. Selling Spectrum.

Newsgroup: rec.ham-radio
Date: 1989-05-27 12:51:51 UTC
From: julian@bongo.UUCP
Message-ID: <216@bongo.UUCP>
Source record: 18564

I brought this subject up a few months ago and was severely flamed for "Broadcast Bashing" (what dat?). Maybe this time this will be read for what it is: A note about possible trouble on the horizon and the direction from which it may come.

In the May edition of Communications International on page 61 is an article headlined "Marketing the Radio Spectrum". It is a very poorly written and confused article, but the itent is plain. The author is in my opinion an illiterate MBA. He seems to have the broadcast bands and the point to point (2-way) bands all lumped together. The whole article is pretty unreadable, but like most padded ramblings, it is accompanied by a pie chart. The chart is of spectrum use in New Zealand of all places.

There are a few interesting points that the author Robin Foster makes. He mentions "In the US, for example, both the Carter and Reagan administrations proposed auctioning the spectrum, but received substantial opposition from engineers worried about the high level of interference." He further mentions, "The UK too has been considering various proposals, ranging from the auctioning of frequencies to the formation of private sector operators to take over the role of the Radio Communications Division." He mentions that Australia and New Zealand are also looking into peddling spectrum spots.

It turn out that a "UK/US consultant National Economic Research Associates (NERA)" did the study on RF spectrum sales for New Zealand. At the end of the article is piece that says " Robin Foster (The author) is a director of NERA, a firm of micro-economic consultants specialising in broadcasting and telecommunications." There is mention of "a NERA team of economists, engineers and lawyers." Worrying isn't it.

Anyhow, this guy neglects to mention or acknowledge that various bands have various uses and even different propagation. He seems to reduce it all to the spectrum being owned like land and users buying or leasing from the lowest bidder without bureaucrats in the way. I can see it now, Taxicabs buying spots at 2 Megs cos that's really cheap.

Anyhow, despite the knocking on my part, I see this as a real threat, not only to the amateur community, but also to the point to point services, as well as broadcasting. I will be the first to admit that spectrum slots could be sold and the Govt could use the income. What worries me is that the people proposing it haven't a clue about RF. All we need is a bunch of half witted essurient yuppies carving up spectrum and flogging it off to cellular carriers etc.

If anyone would like a copy of this dreary but troubling article, I will be happy to mail a xerox for an sase. Send to:

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

SpaceNews

MONDAY MAY 29, 1989

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly around the world. It is available for UNLIMITED distribution.

* UoSAT-D NEWS *

The operating system for the UoSAT-D PCE is now running in Torrance, California. The UoSAT PCE Software Development Model, a complete hardware prototype but without all of the memory present, arrived at Quadron Service Corporation 10 May 89, with the documentation trailing along behind by two days. Quadron has donated their commercial multi-tasking operating system for use on UoSAT-D and on the AMSAT-NA Microsats.

On 12 May 89, the operating system and the hardware were mated. The spacecraft version of the Quadron software (called qCF) has been under development by Harold Price, NK6K and Skip Hansen, WB6YMH, for several months. Jeff Ward, G0/K8KA and other UoSAT engineers have been keeping Quadron up to date on the latest hardware developments, so minimum delay was expected between the arrival of the hardware and the first successful test.

The UoSAT version of the operating system is very close to the same code as that which runs on the Microsat CPU and on the original qCF host, the IBM Realtime Interface Co-Processor (RIC). The major differences are the timers, the low-level RAMUNIT access, and the low-level I/O drivers. All of the user-level interfaces are the same, allowing the IBM RIC card to be used as an inexpensive software development platform, and allowing for easy exchange of software and ideas between UoSAT and Microsat.

The multitasking operating system and the non-file parts of the C library were brought up on the PCE today. The AX25 driver awaits the PCE-specific HDLC drivers, which should be available shortly. The AX25 driver has already been tested on Microsat and the RIC.

[Story via OSCAR-9]

* OSCAR-9 NEWS *

It looks like OSCAR-9 will NOT be taking any CCD pictures for some time. A revised operating schedule was recently issued for OSCAR-9. Diary software

reloads will still take place on Tuesdays. Digitalker telemetry will follow.
The telemetry channels currently being downlinked via the Digitalker include:

08 : Battery Pack A Temperature (C)
18 : Battery Pack B Temperature (C)
22 : Battery Voltage +14V (Volts)
29 : Spacecraft -Y Facet Temperature (C)
35 : 145 MHz Beacon Output Power (UnCalibrateD)
39 : Spacecraft +Y Facet Temperature (C)
49 : Spacecraft +Z Facet Temperature (C)
59 : Spacecraft -Z Facet Temperature (C)

From Thursday at around 12:00 UTC, the spacecraft will transmit the following
sequence of data at 1200 bits/second:

Telemetry : 60 seconds
News Bulletin : 60 seconds
Whole Orbit Data (WOD) : 150 seconds

This will continue until 06:00 UTC on the following Tuesday when the beacon
will switch off to help facilitate a software reload.

* OSCAR-12 NEWS *

The following is latest operating schedule for FO-12:

DATE MODE OPERATING PERIOD

28May JD 00:56 to 09:08 UTC
03Jun JD 05:46 to 00:44 UTC
09Jun JA 04:25 to 21:20 UTC

* OSCAR-13 NEWS *

The following operating schedule for AO-13 is expected to remain in effect
for the next few months:

Date 14Jun89 until 16Aug89 16Aug89 until 16Nov89
Attitude 180/0 210/0
Mode-B MA 0 to MA 110 MA 3 to MA 160
Mode-JL MA 110 to MA 145 MA 160 to MA 200
Mode-B MA 145 to MA 255 MA 200 to MA 240
OFF % MA 240 to MA 3
Mode-S MA 150 to MA 160 MA 210 to MA 222

Transponders will be in operation during the whole orbit from June 14 until
Aug 16 due to excellent sun angle and power budget. No perigee operation
between August and November due to perigee solar eclipses!

* RS-10 NEWS *

The RS-10 mode 'A' transponder now works without limiting of its output power
on each of its 10, 4KHz wide, subchannels. The limit was about 400 mW for each
of the subchannels. PEP output power of the transponder is 5 watts.

* MICROSAT NEWS *

The planned downlink frequency of BRAMSAT's project "DOVE" MicroSat was
recently changed from 145.970 to 145.825 MHz, the same 2-meter frequency used
by OSCARs 9 and 11. This move will make it possible to use existing UoSAT
receivers to pick up signals from DOVE once it is launched and in operation.

The MicroSats are currently scheduled for launch on November 9, 1989.

** UoSAT-D News **

The operating system for the UoSAT-D PCE is now running in Torrance, California. The UoSAT PCE Software Development Model, a complete hardware prototype but without all of the memory present, arrived at Quadron Service Corporation 10 May 89, with the documentation trailing along behind by two days. Quadron has donated their commercial multi-tasking operating system for use on UoSAT-D and on the AMSAT-NA Microsats.

On 12 May 89, the operating system and the hardware were mated. The spacecraft version of the Quadron software (called qCF) has been under development by Harold Price, NK6K and Skip Hansen, WB6YMH, for several months. Jeff Ward, G0/K8KA and other UoSAT engineers have been keeping Quadron up to date on the latest hardware developments, so minimum delay

was expected between the arrival of the hardware and the first successful test.

The UoSAT version of the operating system is very close to the same code as that which runs on the Microsat CPU and on the original qCF host, the IBM Realtime Interface Co-Processor (RIC). The major differences are the timers, the low-level RAMUNIT access, and the low-level I/O drivers. All of the user-level interfaces are the same, allowing the IBM RIC card to be used as an inexpensive software development platform, and allowing for easy exchange of software and ideas between UoSAT and Microsat.

The multitasking operating system and the non-file parts of the C library were brought up on the PCE today. The AX25 driver awaits the PCE-specific HDLC drivers, which should be available shortly. The AX25 driver has already been tested on Microsat and the RIC.

Please use Bulletin ID UOSAT.260A if put on a packet radio BBS.

1042. Callsign servers

Newsgroup: rec.ham-radio
Date: 1989-05-27 20:45:33 UTC
From: SKOHC@CUNYVM.CUNY.EDU
Message-ID: <8905280723.AA15342@ucbvax.Berkeley.EDU>
Source record: 18567

Hi all. I have a question about the 2 callsign servers that were mentioned in previous postings.
Regarding the n6oyu server, what is the stations IP address? And, what route should I use from NYC via TCP/IP 2 meters?
Regarding the Marvin.cs.buffalo.edu server, Is it possible to access it from a bitnet node? I tried Tel Marvin.cs.buffalo.edu, but couldn't get it to work.
Thanks, Joe, kc2yu, skohc@cunyvm, 44.68.0.56

1043. HV caps for Tektronix 531A ?

Newsgroup: rec.ham-radio
Date: 1989-05-27 22:56:41 UTC
From: john@wa3wbu.UUCP
Message-ID: <426@wa3wbu.UUCP>
Source record: 18565

This isn't totally Ham-radio related but I hope someone can point me
in the right direction. A friend just acquired a used Tektronix 531A
O-scope. Big, heavy but not a bad general purpose bench scope when gotten
for free. :-) Anyway, it appears to have a few bad caps in the HV power
supply. He showed them to me and they look tubular, perhaps paper. The
values are .0068uf @ 5KV and .00047uf @ 10KV. I've searched through all
my component catalogs and nothing I have shows anything with this high
of working voltage. Anyone know where we could purchase replacements from ?
Would something like this still be available from Tektronix and would
the price scare me ? :-) If anyone can offer any suggestions it would
be appreciated. This guy is just going through Tech school and its his first
O-scope (remember when ?) :-) Thanks!

I had the same problem with my 531A a few years back. Those black Sprague
tubular caps seem to have been fairly unreliable, even in lower voltage
applications. Anyway I replaced the bad ones with high voltage disc
ceramic caps made for TV sets. But I don't remember where I got them, and
maybe you can't get them anymore now that TV sets are solid state.
But maybe you could ask at a TV repair shop, if there are such things
anymore.

1045. Re; Vertical Antenna Design

Newsgroup: rec.ham-radio
Date: 1989-05-28 06:04:00 UTC
From: CSMSCST@OAC.UCLA.EDU
Message-ID: <8905280724.AA15407@ucbvax.Berkeley.EDU>
Source record: 18568

On 23 May 89 19:21:47 GMT, Ken Thompson posted:

I was planning to build a 1/4 wave antenna with drooping radials. With 1/4 inch tubing for elements, I've been instructed to shorten the vertical 2-3% to compensate for the velocity factor and to make the radials 5-7% shorter than a 1/4 wave. My book says make the radials slightly longer than a 1/4. Any opinions on which is right, or works best? Would not these look electrically the same?

Practically speaking, it won't make a bit of differnce. What you are constructing is an approximation to a 1/4-wave monopole over an infinitely large ground plane (or conducting half space, if you want to talk like an antenna physicist). The radials are not a tuned circuit element, and their length is not critical.

One constructs a vertical with a drooping ground plane for some or all of the following reasons:

1. The impedance of a 1/4-w monopole is about 35 ohms. This yields an SWR at resonance of 52/35 or about 1.5 when fed with standard 52 ohm coax. Drooping radials increase the resistive component of the feedpoint impedance to around 50 ohms, providing a better match.

2. The lobes of radiation from a monopole over a ground plane are skewed slightly above horizontal. Drooping radials may flatten the pattern and direct more signal toward the horizon where it can do some good. However, this is likely to occur only with VHF/UHF antennas since HF antennas are not usually high enough off the (real) ground.

3. A 1/4-wave radius skirt will act as a choke and decrease currents flowing in the outside of the coax feedline. Those currents tend to skew the radiation pattern upward, away from the horizon. This is the theory behind antennas such as the AEA Isopole. With only 4 radials, this effect is probably minimal; the Isopole has a solid skirt.

4. It may be easier to construct drooping radials at HF than horizontal ones. Never underestimate convenience.

I strongly recommend "The Amateur Radio Vertical Antenna Handbook" by Paul Lee, published by CQ, for a general understanding of vertical antennas. He spends much time stressing the importance of grounds in vertical antenna

design.

If you must err, err on the side of too much ground plane, rather than too little. Remember the discone -- it has a 10:1 frequency range, but cuts off abruptly at the point where the skirt becomes a 1/4 wave.

1046. Need schematic for Uniden XE 200 cordless phone

Newsgroup: rec.ham-radio

In article in digest V89 #369, James D. Corder (isolated@alix.UUCP) writes:
>...keep it out of my home!

Well I have to say I disagree with your analogy. If you didn't want your neighbor's dog "poo poo"ing on your lawn, you'd put a fence up. If you want, you can find ways of keeping physical objects out. But radio waves are a different bird.

Following your logic might eventually lead to "well, since they are going thru my home anyway, I can probably alter them...hey, maybe I can even broadcast them! To hell with the FCC!" The whole reason the FCC was established was to regulate the resource of radio waves.

Do you tell the phone company that when you move the coax they have run in your yard (if you have buried utility lines) is yours and you are taking it with you? And are the sewers from your house engraved with your name?

If you say that radio should not be protected by laws, well I can think of a whole bunch of other aspects of humanity that are regulated and nobody really complains. It's just life in a democracy.. You can be happy that even with the ECPA the FCC doesn't have radio-police that are watching your every move.

CARIBBEAN EMERGENCY COMMUNICATIONS

At the invitation of the United Nations Disaster Relief Organization's Pan Caribbean Disaster Preparedness and Prevention Project Director, and sponsorship of the Agency For International Development's Office of US Foreign Disaster Assistance, ARRL Field Services Manager Richard Palm, K1CE, traveled to Trinidad in March to attend a PCDPPP conference on emergency telecommunications. The PCDPPP organized the meeting of telecommunications officials in conjunction with CARICOM, the Caribbean Community and Common Market.

The conference objectives were to review recent disaster experiences, improve operational procedures, review emergency telecommunications facilities and mechanisms, strengthen network services against disasters, and develop proposals for a regional response mechanism.

In addition to national telecommunications ministers, there were several experts on hand to advise conferees on matters within their areas of expertise. OFDA Telecommunications specialist Art Feller, KB4ZJ, and Texas A & M authority Pierre Catala, WA1UAT, served in this advisory role. Other participants included recognized leaders of the region's amateur community, most notably Dr Eric Munroe, 6Y5EE, the principal Amateur Radio player in the Jamaican relief effort following Hurricane Gilbert.

Conferees discussed a proposal for a CARICOM emergency response and relief mechanism. Goals would be to ensure a coordinated response to disasters in the community by member states, and maximize the impact of resources and institutional capacity available in the event of a disaster. Amateur Radio would be written into the plan to facilitate warnings, mobilization/planning in the pre-event period, and resource mobilization in the post-event period.

A highlight of the conference was Dr Eric Monroe's review of the Amateur Radio role in the Hurricane Gilbert disaster relief effort in which amateur support operation was maintained for eight days with 1400 pieces of emergency and/or priority traffic handled by the thirty seven participating amateurs. Dr Monroe is the Jamaica Amateur Radio Association's Disaster Communications Coordinator.

The conference afforded ARRL an excellent opportunity to make contacts with the region's telecommunications and Amateur Radio leaders, and develop an appreciation for their needs in disaster communications planning. The amount of attention the conferees devoted to discussions of the role of Amateur Radio in their plans was most impressive.

DAYTON HAMVENTION AWARDS PRESENTED

More than 30,000 amateurs from more than 20 countries attended the 38th annual "mega event" at the Hara Arena Exhibition Center in Dayton Ohio on April 28-30.

Three awards were presented at the convention banquet. Dayton's Amateur of the Year award went to Bill Pasternak, WA6ITF. Bill has been published in QST, CQ Magazine, World-Radio News, 73 and others. Bill has worked as technical supervisor and field producer for three major ARRL video tape productions: "Amateur Radio's Newest Frontier, SAREX" and the award winning "The New World of Amateur Radio". Bill wrote, produced and recorded amateur radio public service "spot" announcements featuring famous entertainers and conceived and instituted Westlink Report's "Young Ham of the Year" Award.

Phil Karn, KA9Q, was the recipient of the Special Achievement Award. Phil, licensed since 1971, has been an AMSAT volunteer since 1980. An early contributor to the PACSAT/MICROSAT design concept, Phil's major project has been the development of a computer networking package tailored for amateur packet radio. In November 1988, he was elected to the AMSAT Board of Directors.

The Technical Excellence Award went to Byron Goodman, W1DX. First licensed in the early 1930s, Byron is one of the true technical giants in Amateur Radio.

He was the first editor of the ARRL Antenna Handbook, now considered a world standard for antenna design.

Byron's most important contribution to Amateur Radio was recognizing the value of single sideband. He encouraged amateurs to experiment with this new mode, primarily through his QST column "On The Air With Single Sideband". He also had a hand in establishing the famous DXCC program.

Congratulations to all three award winners. (TNX DARA)

The ARRL Letter, Volume 8, No. 9, May 5, 1989 - Part 2 of 3

Editor: Tom Hogerty, KC1J

NATIONAL REPEATER DATA BASE ALIVE AND WELL

A special forum was held at the Dayton HamVention for the purpose of introducing the on-line availability of the National Repeater Coordination data base to potential participating coordinators. At this demonstration, Willem "Van" Van Aller, K3CZ, outlined the history of the data base project, stemming from a major push at the NE coordinators meeting in White Plains, NY, in 1985, and moving somewhat sporadically through several changes in scope and direction to the present newly available system.

At the conclusion of the presentation, Van and Salavatore L D'Anna, WA3KOK, of TMARC demonstrated a successful on line access of the data base at ARRL HQ in Newington, and showed how it would be used to access news and message type mailboxes, as well as the upload and download of coordination information files. Many thanks to the HamVention staff for making the demonstration possible with a last minute installation of a telephone line in the meeting room.

Applications are now being taken by Jay Mabey, NU0X, System Administrator, ARRL HQ for registration as a user of the data base. Currently, the data base contains the total technical information used by TMARC for their routine coordination purposes, as well as directory level information for many other areas of the country. The latter needs to be enhanced and expanded to the full format by the affected coordinators. Safeguards built into the data base program prevent coordinators from viewing other coordinators' information without permission.

Additional information is available in recent and future Repeater Coordinator News Letters. TNX K3CZ.

RETRANSMISSION OF ATLANTIS COMMUNICATIONS

Frank Bauer, KA3HDO, president of the Goddard Space Flight Center Amateur Radio Club (GSFC), WA3NAN, has invited all radio amateurs to listen to the live voice communication transmissions between the astronauts on board the space shuttle Atlantis and Mission Control in Houston. The retransmissions are conducted on these HF frequencies: 3.860, 7.185, 14.295, 21.395, and 28.650 MHz. OSCAR Satellite enthusiasts are able to listen on the AO-13 downlink frequency of 145.955 MHz whenever mode B operation is in effect. Amateurs local to WA3NAN in the Greenbelt MD area are able to monitor 147.45 MHz simplex as well as watch what is going on by tuning into the Metro Vision ATV repeater on 439.25 MHz.

The launch, first slated for Friday, April 28 from Cape Canaveral was held at the 31 second mark and was rescheduled for Thursday, May 4th.

The primary mission of STS-30 is to deploy the interplanetary space probe Magellan launching it on its 15 month flight to the planet Venus. It is the first interplanetary probe launched by the US in 10 years. Continuous retransmissions will occur for the first 6 hours and 18 minutes of the mission up to the time the probe is deployed. After that retransmission of communications will occur only during the shuttle crew's waking hours.

GSFC regularly retransmits Shuttle missions with the permission of NASA and the FCC.

U4MIR/U5MIR QRT

Cosmonauts Alexander Volkov U4MIR, Sergei Krikalev U5MIR, and Valery Polyakov packed their bags and returned to Earth at 0659 Moscow time on April 27th. Problems with the space station's electrical subsystem are being blamed as the cause for all three Cosmonauts evacuating MIR. This is only the second time the space station has been empty since it was launched in February, 1986.

MIR was placed in a parking orbit at an altitude of 500 km. and will remain empty until a repair team returns in August to correct the problem.

AMSAT CHOOSES MICROSAT LOGO

Congratulations to Marc de Filippis, F6EZH, for submitting the winning design for the AMSAT-NA MICROSAT Logo Design Competition announced last November. Marc's idea was chosen because it best "typifies" the concept of Amateur radio satellites. His concept represents, through the use of five brilliant colors, the ARIANE rocket lifting the MICROSATs to outer space and the five continents they will serve each day.

John Champa, K8OCL, AMSAT-NA Executive vice president has given the "go-ahead" to turn F6EZH's design into a 3" diameter patch. The design will also be enlarged and reproduced in the form of a large decal which will be affixed to the side of the ARIANE rocket that will launch the MICROSATs later this year. Patches will be available soon from AMSAT-NA Headquarters.

The ARRL Letter, Volume 8, No. 9, May 5, 1989 - Part 2 of 3

Editor: Tom Hogerty, KC1J

"CQ FIELD DAY, CQ FIELD DAY"

It's May, and while most folks are enjoying the flowers and thinking about their summer vacations, hams are thinking about Field Day June 24-25! Complete Field Day rules appear in the May issue of QST on page 103.

If you haven't done so already, send for your Field Day package containing publicity kit, dupe sheet, summary sheet and check list by sending a 9 X 12-inch SASE containing 4 units of first class postage or 4 IRCs to ARRL HQ, Special Requests, 225 Main St, Newington, CT 06111.

This year additional bonus points have been added for public relations. In addition to 100 points for media publicity, points have been added for operations in a public place and for conducting an information booth for the visiting public.

WHAT'S HAPPENING WITH PRB-3?

ARRL Executive Vice President David Sumner, K1ZZ told the ARRL Executive Committee at its April 1, Kansas City meeting that no FCC action had been taken on the possible privatization of amateur call sign assignments PRB-3, and that the likelihood of positive Commission action is waning with the passage of time. ARRL has reaffirmed its interest in, at minimum, finding a

way to resume issuance of club and special event station call signs.

C.L.E. SEMINAR ADVANCE REGISTRATION

There is still time to preregister for the seminar titled "Land-Use Regulation of Federally-Regulated Communications Facilities and the Doctrine of Federal Preemption," nicknamed the PRB-1 seminar. It will be held at the ARRL National Convention in Dallas/Ft Worth on Saturday, June 3 from 8:30 AM-12:30 PM.

Although you may register at the door, preregistration is being handled by the Regulatory Information Department at HQ.

Written course material will be provided to advance registrants by mail or at the door. There is a charge for written materials, but admission to the seminar is free to anyone not desiring them.

See the February 11, 1989 issue of The ARRL Letter for additional details on the seminar.

LT. GEN. FRANCIS H. (BUTCH) GRISWOLD, K0DWC, SK

The April 15 issue of the Washington Post reported the passing of Air Force Lt. Gen. Francis H. (BUTCH) Griswold, K0DWC. General Griswold enlisted in the Army in 1928 and received his commission in the Army Air Corps in 1929. After his promotion to major general in 1946, his assignments included those of commander of the Third Air force in Britain.

During the mid 50s, K0DWC and W6EZV, General Curtis LeMay, put Collins ham gear on an Air Force plane and flew around the world, staying in touch with Offutt AFB, Omaha, Nebraska the whole time. This proved the concept of HF SSB for Air Force use and allowed them to convert to this mode of communication without incurring extensive research and development costs.

The amateur community will miss K0DWC. Thanks to Richard M. Seamon, W3IUS for passing along this information.

HQ EDITORIAL CHANGES

Effective with this edition, Tom Hogerty, KC1J, takes over as Editor of the ARRL Letter. Tom is Manager of the Regulatory Information Department at HQ.

Outgoing Editor Jay Mabey, NU0X has assumed responsibility for editing the ARRL Repeater Directory. With Phil Sager's, WB4FDT departure from HQ, John Hennessee, KJ4KB is now Conductor of QST's League Lines and Happenings Columns.

>values are .0068uf @ 5KV and .00047uf @ 10KV. I've searched through all
>my component catalogs....

I couldn't find the exact values you mention, but with paralleling,
the following might do:

Disc Ceramic capacitors:

.001 uf 3000 VAC/10 kV DC $5.95
.0025 uf 4500 VAC/15 kV DC $12.95

--- from p.54 of RadioKit's 1988 catalog, perhaps out of date since
they claimed their 1989 catalog would be out in April. They can be
reached at:

Radiokit (603) 635-2235
P.O. Box 973 TELEX 887697
Pelham, NH 03076

Of course, Fair Radio Sales is often good for obscure/antique parts
of WWII vintage. For sheer voltage, you can't beat

Plastic capacitor
0.02 mf 120,000 WVDC 17.5"x6.3"x4.5" 18 lbs $120

though this may not be what you need (:-). I didn't see any of the
caps you wanted in their '89 catalog but their address is

Fair Radio Sales Co. (419) 223-2196 / 227-6573
P.O. Box 1105 FAX (419) 227-1313
1016 E. Eureka St.
Lima, Ohio 45802

...their catalog may have an organization, but it escapes me. You
just have to wander through the tube-type walkie talkies and 135 Volt
batteries ("weak..."). Std. disclaimer: no affiliation with above
companies and no warranty express or implied. Hope this helps!

> center-fed Zepp oxymoronic? I thought Zepp referred
> to the antenna for a Zeppelin which was a trailing
> dipole fed at the end? I'm not trying to be picky,
> I just always wondered.
Nope, the Center-fed Zepp is still correct. Any antenna that is connected
to a transmission line end fed ... The Center fed zepp is a pair or 0.64
wave elements. The center 0.14 on each side used to be a transmission line,
but it was found that the cancelling radiation from that section is minimal
when part of the antenna (3.4 db down to 3.1 db over a half wave dipole).
That 0.14 wavelength section is end feeding (voltage feeding) the half wave
section. Even if the antenna doesn`t have the 0.14 wavelength section feeding
the half wave (a full wave dipole?), there is still a transmission line
voltage feeding (end feeding) an antenna. You just have a pair of them ...
In fact you can view this antenna as a co-phased pair of half waves separated
by 0.28 of a wavelength. Or, if you want, it can be viewed as the dipole
equivalent of a 5/8 wave antenna (if a dipole is compared to a counterpoised
1/4 wave). The original Zeppelin antenna was an end fed half wave fed by a
quarter wave transmission line (to transpose it to current feed), later fed by
any length of transmission line (but longer than quarter wave). A J pole is
another version of this antenna.

Now, lets count the names ....

1053. London International Airshow

Newsgroup: rec.ham-radio
Date: 1989-05-29 20:38:00 UTC
From: ppddc@uwocc1.uwo.ca
Message-ID: <0612463354@uwovax.uwo.ca>
Source record: 18575

The London (Ontario) International Airshow gets off the ground this Saturday and Sunday with over 90 military aircraft coming in from 14 NATO nations. The 25th anniversary of the first flight of the F-111 and NATO's 40th anniversary will be featured.

There will be an amateur radio special events station set up (beside the beer tent) to promote amateur radio. This small scale station is being established courtesy of the 427th Wing of the Royal Canadian Airforce Association and will be operating under the call sign VE3YXU (YXU is the airport identifier).

We welcome those attending the show to stop by and sign our visitor log. We also would like to make as many contacts as possible to show the organizers that amateur radio can make a very positive addition to their event.

73 and please don't hesitate to request further information.

RS 12/13 LAUNCH IMMINIENT!

HR AMSAT NEWS SERVICE BULLETIN 147.01 FROM AMSAT HQ
SILVER SPRING, MD MAY 27, 1989
TO ALL RADIO AMATEURS BT

RS 12/13 Is Scheduled To Be Launched In June

AMSAT-NA has learned from Ron Broadbent, G3AAJ, that the launch of RS 12/13 is imminient. This information was made available from reliable Russian sources familiar with amateur satellite activities in the Soviet Union. It is felt by G3AAJ's colleagues in the Soviet Union that the launch of RS 12/13 will occur sometime in June.

RS 12/13 will closely resemble RS 10/11 in many ways. It will support modes A, K, KA, KT, and T; also RS 12/13 will possess a "robot." Like RS 10/11, this new Radio Sputnik "bird" will fly "attached" to a maritime navigational satellite. The preliminary orbital characteristics are the following: 1000 mile circular orbit, 83 degree inclination, and 105 minute nodal period [equator-to-equator]. AMSAT-NA urges all OSCAR enthusiasts to monitor the planned beacon frequencies of 29.408 MHz for RS 12 and 29.4582 MHz for RS 13. The "robot" downlink frequencies for RS 12/13 will be 29.4543 MHz and 29.5043 MHz, respectively. At the present time it is unknown which beacon and/or "robot" will be turned on first after launch. Amateurs wishing to use RS 12/13 should look for transmissions on all four frequencies mentioned above.

If you should hear the CW beacon on these frequencies for RS 12/13, please contact AMSAT HQ's [(301) 589-6062] so that this information can be passed along to AMSAT Net Control Stations for announcement during the many regular AMSAT Nets each week. Please include the date, time, frequency, your call, and QTH. In the meanwhile, all those who have Amateur Satellite Report (ASR) #183 can refer to it for the "preliminary" bandplan information. When the exact frequencies are known, AMSAT-NA will publish them as quickly as possible in ASR, post them on the AMSAT-NA BBS [(303) 447-3003], and will also make them part of the next AMSAT News Service (ANS) Bulletins.

When informed of this, Doug Loughmiller (KO5I), AMSAT-NA President, indicated that amateur satellite enthusiasts would be watching the developments with great interest and anticipation. Doug also added: "We wish our Russian

colleagues great success with their latest endeavor."

SB ALL @ AMSAT $ANS-147.02
DOVE DOWNLINK FREQUENCY REVISED

HR AMSAT NEWS SERVICE BULLETIN 147.02 FROM AMSAT HQ
SILVER SPRING, MD MAY 27, 1989
TO ALL RADIO AMATEURS BT

Further Clarification Provided On The Dove Frequency Change To 145.825 MHz

AMSAT-NA regrets thats there were errors in the reporting of this topic in AMSAT News Service (ANS) Bulletin ANS-139.02 last week. AMSAT-NA hereby provides this further clarification and apologizes for any confusion or misconceptions that resulted from our initial report of this topic.

As announced last week in ANS-139.02, BRAMSAT President, Dr. Junior de Castro (PY2BJO), has given the "OK" to move the Digital Orbiting Voice Encoder (DOVE) downlink frequency to 145.825 MHz. AMSAT-NA, BRAMSAT, and the University of Surrey officials would like to further explain the reasons justifying this bandplan change. Several months ago, Dr. Martin Sweeting (G3YJO) of the University of Surrey initiated a "orbital mechanics" analysis to study the potential for mutual interference if both DOVE and UO-11 used the same downlink frequency of 145.825 MHz. It was found by studying the AOS and LOS times for the projected DOVE orbit and the current UO-11 orbit there would only be a few occasions when DOVE and UO-11 would appear simultaneously over the same QTH; thus, mutual QRM would be minimal. After careful study of the results of this analysis, Martin Sweeting (G3YJO) offered the suggestion that DOVE change frequencies to Jan King (W3GEY), AMSAT-NA VP for Engineering and MICROSAT Program Manager. It was obvious from a engineering standpoint that the only impact this would have was a change in crystals in the DOVE transmitter and this change could be easily accomodated. After Jan King presented this suggestion to BRAMSAT President, Junior de Castro (PY2BJO), Junior agreed with this suggestion that DOVE should also utilize this established frequency for amateur educational and scientific satellites.

It is hoped that this brief discussion will clear up any misconceptions regarding this frequency selection for the DOVE downlink.

N4HY ATTENDS MEETINGS IN PARIS

HR AMSAT NEWS SERVICE BULLETIN 147.03 FROM AMSAT HQ
SILVER SPRING, MD MAY 27, 1989
TO ALL RADIO AMATEURS BT

Bob McGwier (N4HY) Attends Meetings With Arianespace Officials In Paris

Bob McGwier (N4HY), AMSAT-NA Assistant VP for Engineering, met with Arianespace officials to discuss many important topics related with the launch of the MICROSATs during his brief trip to Paris on May 10-11th. Also in

attendence was Dr. Martin Sweeting (G3YJO) representing the University of Surrey as well as SPOT-2 payload representatives. This AMSAT News Service (ANS) Bulletin will only cover the major points of these very important meetings.

The launch of the ARIANE IV carrying SPOT-2, UOSAT D & E, and the MICROSATs has now been set for November 9, 1989 at 01:35:27 UTC. The first major pay-load separation event occurs after a Mission Elapse Time (MET) of 17 minutes 8 seconds after launch when the SPOT-2 satellite separates from the 3rd stage of the ARIANE IV. After a reorientation maneuver of the 3rd stage is performed, at 20 minutes 9 seconds (MET) UOSAT D & E will be released. Next, after another reorientation maneuver of the 3rd stage is accomplished, at 21 minutes 6 seconds MET all four of the MICROSATs will be separated from the 3rd stage. Finally, the 3rd stage will vent any remaining fuel it has left in its tanks and simultaneiously perform a "collision avoidance" maneuver. By the end of the first day, it is predicted that the MICROSATs will be approximently 1000 km away from SPOT-2 and anywhere from 70 to 170 km away from UOSAT D & E. The MICROSATs, it is predicted, will be separated from each other by distances that range from 30 km to 100 km.

On May 11th a fit check was performed with the vibration "test-model" to see how well the MICROSATs would mate to the Ariane Small Auxillary Payload (ASAP) structure. It was found that except for a small cable that needed to be re-routed, the vibration test-mode fitted perfectly in all of the four positions where MICROSATs would be mounted on the ASAP structure. The only other concern was expressed about the DOVE 2m downlink antenna. A special "cup-like" struture will be fabricated to "spiral" that particular antenna inside of and hold it there until DOVE separates from the ASAP structure. It was felt by the engineers involved that this would allow the "long" 2m downlink antenna to uncurl nicely from the spacecraft at separation. The major concern was that the tip of the 2m downlink antenna might touch some of DOVE solar cells at separation from the ASAP structure.

Bob McGwier (N4HY) indicated that series of meetings with Arianespace officials went extremely well. The "fit check" was one of the major "milestones" which had to be passed in order to have the MICROSATs "approved" for flight aboard the ARIANE IV launch vehicle this November.

A Summary Of All Planned Amateur Radio Satellite Launches

Last week Tom Clark (W3IWI) had a chance to talk with Eduardo Dias who is the manager of a satellite tracking station in Santiago Chile. This was one of the tracking stations which supported the launch of the Japanese H-1 rocket that carried FO-12. Eduardo mentioned that the next Japanese launch of their H-1

rocket has been set for January 23, 1990. Eduardo said that he had been contacted by the JARL and asked if he could provide amateur radio support since JAS-2 will also fly on this mission. JAS-2 will be the "follow-on" to FO-12.

At this point AMSAT would like to give a quick "run-down" of all known amateur radio satellite launch activies scheduled for next several months.

SATELLITE LAUNCH DATE
========= ===========
RS-12/13 June '89
PACSAT 11/09/89
LUSAT 11/09/89
DOVE 11/09/89
UOSAT D 11/09/89
UOSAT E 11/09/89

SB ALL @ AMSAT $ANS-147.05
U2MIR HAS DINNER AT W4PUJ QTH

HR AMSAT NEWS SERVICE BULLETIN 147.05 FROM AMSAT HQ
SILVER SPRING, MD MAY 27, 1989
TO ALL RADIO AMATEURS BT

Musa Manoroff (U2MIR) Visited W4PUJ And Others For An "Eyeball" QSO

On the evening of May 12, Dick Daniels (W4PUJ) along with Tom Clark (W3IWI), John Shew (N4QQ), Martha Saragovitz (XYL of N4QQ), Rich Zwirko (K1HTV), and the XLY's of W4PUJ, W3IWI, and K1HTV, all had the privilege of meeting the MIR Space Station Cosmonaut Musa Manaroff (U2MIR). Musa was in the US to visit with NASA space medicine specialists as a "specimen" to prove that humans can survive 366 days in space with no long term ill effects. Through their contacts in NASA, W3IWI and W4PUJ were able to arrange a dinner party for Musa at W4PUJ's QTH.

During the dinner party, Musa told many humorous anecdotes about his year long stay in outer space. He commented about spending "366 times 16" [orbits/day] nights away from his wife and children (ages 7 and 8). Musa talked about the size of Mir which was about two normal rooms. Musa emphasized that when the Yaseu FT-290 tranciever arrived in November of '88, amateur radio operations from Mir provided a great deal of enjoyment. Although Musa is an electrical engineer, before he was licensed in space aboard Mir, he was only a SWL. Musa said that he hopes to remain active in amateur radio and keep his U2MIR call.

Later in the evening Musa had a chance to see W4PUJ's hamshack and enjoyed tuning around the 20M band and also listening to the downlink passband of AO-13. Tom Clark showed Musa some of the receiver modules he was building for the MICROSATs and also the "little" packet unit (Tasco/Heath HK21 TNC) which Astronaut Ron Parise (W4SIR) will carry on a future Space Shuttle mission.

In saying "73's" for the evening, W3IWI on behalf of AMSAT, presented Musa an honorary "life-membership." Musa also recieved one the new MICROSAT patches. In summary, it was a very enjoyable evening for all those who attended this "eyeball QSO," and it only proves without a doubt that Amateur Radio certainly does promote international goodwill and friendship.

AMSAT SHORT BURSTS

HR AMSAT NEWS SERVICE BULLETIN 147.06 FROM AMSAT HQ
SILVER SPRING, MD MAY 27,1989
TO ALL RADIO AMATEURS BT

AMSAT Short Bursts

The following will be the operating schedules for AMSAT OSCAR-13 for the next several months. Please post this in a convenient place in your ham shack for quick reference.

M de VK5AGR 14May89: *** AO-13 Transponder Schedule Update ***
14May89 to 14Jun89
Mode-JL from MA 160 to MA 200 ! Mode-B from MA 200 to MA 160
Also, for a trial period the OMNI-directional 70cm antenna will
be connected to the Mode-B RCVR from MA 20 to MA 40. These changes
have been introduced to enable stations who have access around
perigee to experiment with perigee operation. Mode S unchanged.
14May89: BLON/BLAT 212.0/+2.4 with a drift rate of 0.016/-0.061 deg/day,
respectively.

O S C A R - 1 3

Date : 14Jun89 until 16Aug89 ! 16Aug89 until 16Nov89
Attitude: 180/0 ! 210/0
Mode-B : MA 0 to MA 110 ! MA 3 to MA 160
Mode-JL : MA 110 to MA 145 ! MA 160 to MA 200
Mode-B : MA 145 to MA 255 ! MA 200 to MA 240
OFF : % ! MA 240 to MA 3
Mode-S : MA 150 to MA 160 ! MA 210 to MA 222

Transponders will be in operation during the whole orbit from June 14 until Aug 16 due to excellent sunangle and power budget. No perigee operation between August and November due to perigee solar eclipses!

In celebration of the 75th anniversary of the founding of the American Radio Relay League, there will be a commemorative station operation under the callsign of W1AW/5 on 2-4 June, 1989. This activity will take place at the ARRL National Convention in Arlington, TX. The hours of operation will be from 17:00 UTC on Friday, 2 June through 18:00 UTC on Sunday, 4 June. In keeping with the convention theme "FROM SPARK...1914-1989...TO SPACE," a "deluxe" satellite station will be set up. It is the intention of the station planners to operate this station on every pass of every Amateur Radio Satellite that comes within view of Arlington, Texas during this operating period. All modes of operations will be supported from Mode A, B, J, and L.

So listen and try to work W1AW/5 on every OSCAR satellite you can. Crank up your satellite tracking programs and check for windows "of mutual visability" to Arlington, Texas, for 2-4 June,1989. For those with QT4.0 who would like to use the "mutual visibility" option, Arlington, TX has the following coordinates: Long=97.083W, Lat=32.750N, and Height above sea-level: 210 Meters.

AMSAT is seeking additional Area Coordinators throughout North America. These additional members of the Field Operations organization are needed to support the expected inrush of activity and excitement centered about the launch of an additional six or seven amateur radio satellites this year. AMSAT-NA is seeking those who wish to promote the Amateur Radio Satellite program, and primarily, those experienced satellite users who will serve as "Elmers" for aspiring satellite enthusiasts. If you are interested in joining this team of "make it happen" amateurs, contact the AMSAT VP of Field Operations:

Jack Crabtree, AA0P
4327 W. Bellewood Dr.
Littleton, CO 80123
(303) 795-7736

Many AO-13 users are unaware that there is an AMSAT Operations Net which is conducted on AO-13 several times each month to help answer questions about OSCAR satellites and to provide information about the many exciting things going on in AMSAT. The following is a list of the times for the Ops Net. Please place this list in a convenient place in your OSCAR station so that you won't miss out on this interesting net which is offered as a service to all AMSAT members.

Here is the Ops Net schedule through June:

Date UTC orb-phs NCS

28 May 0200 731-105 (27 May local)
04 Jun 0300 746-045 (03 Jun local)
11 Jun 0000 760-152 (10 Jun local)
18 Jun 0100 775-092 W0RPK (17 Jun local)
25 Jun 0300 790-055 (24 Jun local)

Nets can be held on B or JL, but if the AO-13 satellite schedule is changed such that the Ops Net falls during an "off" period, it will be rescheduled. Downlink frequencies are 145.950 MHz and 435.970 MHz for Mode B and JL, respectively. All these are for AO-13 but AO-10 is sometimes used when available.

The following is the operating schedule for FO-12 for the rest of the month of May and for June:

DATE MODE OPERATING PERIOD
05/28/89 JD 00:56 UTC until 09:08 UTC
06/03/89 JD 05:46 UTC until 00:44 UTC on 06/04/89
06/09/89 JA 04:25 UTC until 21:20 UTC
06/21/89 JA 01:43 UTC until 18:38 UTC

06/24/89 JA 01:03 UTC until 17:58 UTC
06/29/89 JA 00:35 UTC until 15:29 UTC

de DB2OS 01May89: *** AO-10 TRANSPONDER SCHEDULE ***
01May89 to 13Jul89

Mode-B : from MA 025 to MA 225
OFF : from MA 226 to MA 024

All radio amateurs who live in the Northern California area are reminded of the "Shasta SpaceCon '89" which will be held in Weed, CA on June 17th at the Student Center of the College of the Siskiyous. This all day seminar is designed to be a "beginners introduction" OSCAR satellites. Many excellent speakers from AMSAT-NA and Project OSCAR will be present. For more information about this fine seminar, please contact Bob Dalleske (W6AMW) at (916) 964-3154.

/EX

1055. MacIntosh software for Novice Ham Test

Newsgroup: rec.ham-radio
Date: 1989-05-30 13:17:09 UTC
From: dls@genrad.com
Message-ID: <21562@genrad.UUCP>
Source record: 18441

I am just in the final "audit" of a MacIntosh Hypercard stack which I created for the Novice Ham Test. I'm still removing typographical errors (and a couple of wrong answers....), but other than that, it's basically complete.

This is an interactive Test stack, which can be use mostly for review prior to taking the Novice Ham test for real....but can also be used to GENERATE the Novice Ham test to give to other new ham hopefuls (I'm one of them....). It is completely multiple choice. The question pool is the entire 302 questions out of the back of "Tune in the World with Radio". The questions which WEREN't multiple choice have been converted to multiple choice by me (about 15 of them). The test consists of 30 questions, one from each subgroup chosen randomly by the Hypercard handler "random". Facility is provided for IMMEDIATE feedback (ie, if you answer the question wrong, before continuing to next question, it will tell you the correct answer). Alternatively, or in addition, you can also get a review of incorrect answers after the entire 30-question test is completed.

You can print a test of 30 questions, along with a separate answer key, although it DOES take some time to print if all you have is an Imagewriter. You can print the results report, which gives time, number and percentage of correct answers, and question numbers of incorrect answers, along with a separate answer key. A help page is provided for how to run it. Graphics are same as those shown in back of "Tune in the World...".

The stack is about 650K long, and will fit on one double sided floppy. Hypercard almost REQUIRES 1Meg and a hard disk to run. I have a 1Meg MacPlus with 32Meg hard drive and ImageWriter II. I did find that printing the 30-question test (NOT the result report) uses a lot of memory and wouldn't run at first. I simply removed most of my Inits and Cdevs that I didn't really need anyway, then rebooted and had no problems printing it....I think I'm gonna get more memory for my MacPlus....

If anyone is interested in obtaining a copy (you must already have HYPERCARD, I won't supply that! I had to PAY for my copy of Hypercard) of Novice Ham Test, send me a double sided diskette and I'll copy it for you.

I still have a couple of enhancements I'm making to it, so any comments, corrections to it would be greatly appreciated. THIS IS PUBLIC DOMAIN SOFTWARE AND MAY NOT BE SOLD BY ANYONE ELSE, although I have no objection to it being included as part of a Morse code Software, for only the cost of the diskette itself. I have MacMorse, and I know the author of that was interested in my Novice Ham Test.

Send diskette (and explanation!!) to:
Diana L. Syriac
49A Meadow Pond Drive
Leominster, Ma. 01453
Be sure to include postage for return mail (uh...one or two stamps?)
and a return address (I'm not telepathic, although my daughter sometimes
is....).

Subject: Living through a toxic accident
RACESBUL.NY1

LIVING THROUGH A TOXIC ACCIDENT.

It could happen in your area - ANYTIME.
BULLETIN: A truck carrying toxic chemicals just overturned near your location, or you learn that suffocating fumes are escaping from a nearby chemical plant, or a nuclear accident...An explosion in a rocket plant in Nevada - thousands evac'd, traffic deadlocked..An overturned truck carrying propane, on Long Island - 1000 families evac'dfor 3 days...A chlorine fire in Springfield, Mass. - 25,000 residents evac'd...

PANIC? or knowing ahead-of-time what steps to take for protection of life and property. According to informed sources, simply going inside a building or vehicle may afford the best protection in cases where short releases of toxic fumes are present.

Studies have shown that brick structures offer 5 times the protection of being outside, and 2 to 3 times the protection of wooden structures.

All agree that in any toxic emergency, the most critical requirement is to remain calm, using radio and TV to keep abreast of developments.

SOME TIPS FROM THE EXPERTS:

Never attempt to drive thru a gas cloud, particularly chlorine or ammonia. A vehicle engine can stall, or catch fire from sparks igniting gases.

If unable to get inside a structure or vehicle, move perpendicular to the wind to escape the highest concentration of gas- never face the source..if possible move at least 1/2 mile from the danger area.

Rail and Truck accidents involving hazardous materials are the most likely to require evacuation, according to transportation authorities.

If forced to leave home following an evac order, primary concern should be personal safety. Lock residence, taking only basic needs, particularly avoid taking pets as shelters cannot accomodate them, all according to Ted Gautier, Director of Disaster Operations for the American Red Cross. (A lot of people probably won't leave thier pets

behind to die. ed).

He also states that the ARC strives to have shelters open and fully supplied within an hour or two following a disaster, providing 3 meals a day, cots, blankets, nurses, & child care, all at no cost to the victims.

Gautier also stresses need for pre-emergency planning - pack a small bag with basic needs, incl. port radio, sum of money in hidden wallet compt., and first aid kit including tincture of iodine...Studies at Penna State Univ. have shown that iodine applied immediately after a nuclear accident can block the intake of radioactive materials that can cause thyroid cancer - most effective when applied to hand-sized sections of the forearm. Gautier also recommends keeping car fully fueled where possible.

Know your school, nursing home and hospital evac plans; experts caution however against attempting to pick up people at these facilities unless absolutely necessary - Reason: Possible traffic barricades and/or gridlock, and possibility of danger traveling thru unprotected areas.

LIVING THROUGH A TOXIC
ACCIDENT

If staying inside a
structure, close all doors and windows. Fill bathtub full of water, then turn off water at mains - later addl water may be obtained by draining water heater or toilets, if necesssary.

If in vicinity of suspected dangerous fumes, take short, quick, shallow breaths thru a wet towel as a filter - according to studies at Clark Univ. this one basic step would have substantially reduced the high casualties at the Bhopal, India pesticide plant accident.

If coming in from the outside remove all clothing incl. shoes - take shower - seal clothes in plastic bag for later radioactive check.

1057. Too Much power often used on 10 meters

Newsgroup: rec.ham-radio
Date: 1989-05-30 14:06:25 UTC
From: gdavis@uvm-gen.UUCP
Message-ID: <1191@uvm-gen.UUCP>
Source record: 18445

I wonder if anyothers out there,what with the good prevailing conditions
on 10 have noticed the excess use of power? I use 100 watts and a 4 ele.
yagi at 60 feet and from here in Vt. have received 5/9+15 reports from YB0
land. Why then have so many taken to using 500,1000 0r even 1,500 watts on 10.
It would seem reasonable that even if these linear amps are working properly,
that IMD will be only -35db or so below signal causing much unneeded QRM for
others who would like to enjoy the band. Are there others who have observed this20 meter
mentality transferred to Ten? 73

I am going to the Formula 1 Grand Prix motor race in Montreal June 18,
but only for the day, so I need help in searching out frequencies to
listen to on the scanner. If you are going to be in the Phoenix, Ariz.
area around June 1-4, or the Montreal area around June 13 to 18, would
you please give the V/UHF spectrum a listen, and collect anything you can
on frequencies used by the formula 1 "circus". If you already have info
from previous years (Montreal or Detroit), that would be helpfull also.
For Montrealers: I already have the current Haruteq book, but there isn't
much in there.
If there is any doubt about the info reaching me on time, then call collect
(voice). My home # is (613) 722 5918. thanks in advance 73 mike VE3 FFK

BTW. Thanks for the indy postings, I think they will help later this year
at mosport.

Source record: 18431

You no doubt have been reading the postings about the London Airshow
that takes place this weekend.

Well folks, after months of preparation our plans for a special event
station have gone down the tubes. Why? The airport manager has
rescinded his verbal okay and now tells us we need a special license.
Our local Dept. of Communications inspector has warned that the use
of any ham radio transmitter on ANY government property is illegal
without permission of the commander/manager. This includes a handheld.

It certainly is disheartening to try to promote their event and to
receive this type of treatment. It is also intimidating to know that
there are regulations out there that seem to appear whenever someone
tries to do something innovative. No wonder our hobby seems to be
losing its initiative in this area.0

If anyone is coming to London for the show, please be sure to check in to the
145.390 MGI Repeater. Our group will make you welcome even if the Airshow
organizers and authorities won't! But remember, don't do it from the Show!

1062. SSB Filter for Kenwood TS-440S

Newsgroup: rec.ham-radio
Date: 1989-05-30 15:17:00 UTC
From: STELLABO@CSHLAB.BITNET
Message-ID: <8905310736.AA22373@ucbvax.Berkeley.EDU>
Source record: 18433

I would like to purchase a SSB filter for my Kenwood TS-440s. Kenwood sells two filters one has a band witdth of 1.8Khz the other is 2.1Khz. The manual claims that without any filter the Bandwidth is 2.2Khz. This leads me to think that the wide filter is a bit of a waste. Is there more to it than just bandwidth ? I plan to use the SSB filter for AMTOR, RTTY, and SSB work Is the 1.8Khz to narrow ? Has anybody out there have any experience with any of these filters.

You can mail to me direct at: STELLABO@CSHLAB.BITNET ... I will summarize and post if I get enough responces.

Thanks in advance.

1064. Re: Repeater Isolation without a Duplexer

Newsgroup: rec.ham-radio
Date: 1989-05-30 15:24:01 UTC
From: chris@hplvli.HP.COM
Message-ID: <4590024@hplvli.HP.COM>
Source record: 18435

In Albuquerque, there is a quite successful 443 MHz
repeater running without duplexer using vertical
separation. In fact, the receiver has a ARR GaAs preamp
at the antenna, and there are no desense problems.
The receiving antenna is at the top of a 125' tower,
the transmitting antenna is about 50' up.
Keys to success:
1. Real antennas (ie Celwave Stormchief on the Rx,
Celwave Stationmaster on the Tx.)
2. Good feedline (3/4" Heliax). You can forget isolation
completely if you try to use normal Coaxial cable.
3. Good Tx/Rx isolation all the way to the power supply.
(RF leakage in the shack can be just as big a problem
as coupling on the tower).
4. Good vertical separation (about 70' in this case).
5. Good commercial receiver (GE, in this case) with
helical resonator in teh front end.
6. No other transmitters on the same band at this site.
This is one reason the unprotected preamp could be used.
The preamp (NOT usually a good idea on repeaters) was
added because of the necessity of driving about 200' of
feedline from the receiver.

In most cases, I think you are better off springing
the $500 for a cavity duplexer (on 440 MHz, more on
lower bands). Also remember that Tx/Rx RF isolation MUST
include all wiring in the repeater: Audio, Power,
controller, etc. This (and continuous duty Transmitters)
is what distinguishes a well made repeater from any old
mobile rig.

1065. Pro-2005 WARNING!

Newsgroup: rec.ham-radio
Date: 1989-05-30 15:36:02 UTC
From: john@anasaz.UUCP
Message-ID: <73@anasaz.UUCP>
Source record: 18436
Cross-posted to: rec.ham-radio,sci.electronics

I went to the local Radio Schlock today to look at the Pro-2005 after reading glowing reviews, and after being happy (- desense :-( ) with the 2004 that I own. I was shocked to discover that there is no mobile mounting bracket for the gadget, and now simple way to do it (no bolt holes available for mounting)! It looks like one would have to make some sort of sandwich to hold on to it! This is pretty bad - They make it smaller, with a better keyboard for mobile use, and then they leave out the mounting bracket! Also, in keeping with their strange policy, they don't have a removable power cord.
Sigh.

If anyone comes up with a good mounting for this thing, or finds an after-market one (business idea, anyone?), please post.

Thanks

>Ok, here's a new one to the net. Is it now legal to have an unattended
>HF<->VHF packet gateway? There has been some discussion here locally,
>(Southern Illinois) as to whether this is now allowed, but nobody *really*

This is STRICTLY by memory so PLEASE DON'T take this as gospel. I believe that an HF to VHF gateway probably does require monitoring. The big concern is third party traffic. As I recall, the requirement was waved for VHF since it is unlikely that illegal third-party traffic will be handled by an automatic station, i.e. from a country we don't have an agreement with. This requirement wasn't waved for HF.

From: parnass@cbnewsc.ATT.COM
Message-ID: <1052@cbnewsc.ATT.COM>
Source record: 18437

x
I've received some mail about operating QRPp with my old
Globe VFO, but my electronic responses to some of you
bounced.

The Globe VFO contains no output filtering to prevent
transmission of harmonics, so I'm using a Drake
transmatch between my VFO and antenna. The pi network
configuration acts as a low pass filter to suppress radi-
ation of harmonics. I operate at the low end of 40m cw
(~7.040 MHz) just to be safe, so any harmonics also fall
within amateur bands.

Out of four contacts so far, my best DX has only been
about 900 miles -- Long Island Sound, NY. QRPp operation
is restricted to Saturday and Sunday mornings and early
afternoons, when 40 meters is quiet, otherwise my 100 mw
signal is hopelessly submerged under the static crashes.

Do you use a Heath HW-9 transceiver? How do you like it?
Interested in selling it?

>Ok, here's a new one to the net. Is it now legal to have an unattended
>HF<->VHF packet gateway?

The legality issue has nothing to do with gatewaying HF to VHF, it has to do only with running unattended on HF. That is illegal. However, on request by the major players in the HF packet mail forwarding network and the League, an STA (Special Temporary Authority) was granted to a specific group of hams to do this for a stated period. They are required to submit a report on their experiences at the end of that time. (Now that I think of it, that time should be up about now. Anybody know?)

So, No, you can't just fire up and do it, but Yes, some specified stations are doing it under an STA.

>I got
>smart, or so I thought, I called the Governing body over communications,
>the FCC.

Not meaning to be impolite, but this is almost never the right thing to do. You are likely to provoke a negative answer which will then be used as a precedent. It's much better to ask someone knowledgable, such as the FCC desk at the League or a TAPR or AMSAT person involved with the specific activity to find out the lay of the land first.

Date: 1989-05-30 21:52:37 UTC
From: FTDDR@ALASKA.BITNET
Message-ID: <8905310804.AA24105@ucbvax.Berkeley.EDU>
Source record: 18450

I'm hunting around for a shortwave radio to take on trips. It has to be small, have useable performance, and shouldn't be too expensive (so I can afford to replace it if it gets lost, stolen, or smashed...).

Sony has various models that would seem to fit, but I haven't had any luck finding reviews for them. For example, the ICF-SW1S is billed as a travel radio, with multi-voltage adapter and an active antenna. They've got a couple of low-end models, the 4920 and 7601, that are a little larger but cheap.

I would appreciate hearing from anyone who is using one of these compact SW radios, or who knows where they are reviewed in a magazine.

Thanks very much,
Don Rice

From: kenw@col.hp.com
Message-ID: <4380048@col.hp.com>
Source record: 18440

I currently own two 760XLTs. The most recent one was purchased about a month ago and I noticed that the design had changed from the original. First, the antenna jack was changed from a Motorola style to a BNC. Second, the pc board was relaid out. The rf front end board is now on the opposite side of the main board. The battery compartment has been replaced with a lithium battery. Most other things have remained the same.

However, I am now noticing a new intermod (paging station) coming through on my favorite fire channel! The older model does not exhibit this rude behavior and I'm toying with a helical trap for the paging frequency (if I can locate it!).

Otherwise, the new version seems identical to the first. No, I have not attempted the cellular mod to the second version, so I can not verify if it will still work.

1076. Beepers already being restricted

Newsgroup: rec.ham-radio
Date: 1989-05-31 12:56:02 UTC
From: rgt@beta.lanl.gov
Message-ID: <25281@beta.lanl.gov>
Source record: 18452

I was given a copy of _USA_ _Today_, and saw a "face-off" on the issues. According to this article, Representative Kweisi Mfume (D-Md) says the following (reprinted without permission, spelling errors are probably mine):

The drug business is using the latest technology to promote its deadly trade. One such advance, the paging device, or beeper, is now appearing in classrooms and schoolyards. I have introduced the Beeper Abuse Prevention Act to curtail the use of beepers by young people who deal drugs. It would require the Federal Communications Commission to prescribe regulations that would restrict the possession and use of paging devices by persons under age 21.

Law officers say dealers and suppliers send coded messages via beeper to youths in school. The codes translate into messages like "meet me at our regular place after class to pick up the drugs." Drug traffickers are even using 800 numbers now available with regional paging services. A supplier could actually conduct a transaction in Baltimore from Miami, for example.

My bill, H.R. 1504, would require any person selling or renting paging devices to verify the identification and age of every customer; encourage parents and businesses to take more responsibility in their children's or employees' activities; make it unlawful for a person to knowingly nad willfully rent, sell or use paging devices in violation of rules prescrived by the FCC (there are provisions for stiff fines and up to three-year prison terms for adults who illegally provide beepers to youths); and require parents or businesses who allow the use of beepers to state that intention with and affidavit at the time of purchase.

He goes on to say that he recognizes that there are legitimate uses of beepers, but we can no longer stand by and watch drugs flow into our neighborhoods. The opposite side is taken by Lynn Scarlett, from Santa Monica, CA. She asks what beepers have to do with the drug trade, and regulating their use will not put a dent it it. She also says that there is little evidence that gun control keeps guns out of the hands of gangsters, and it will take a good dose of wizardry to keep beepers away from bad guys. She finishes with:

The logic of the Beeper Abuse Prevention Act opens the door for laws to make us sign promises that we won't, we swear, use these things for illicit acts when we buy them. De Tocqueville, that eminent observer of our nation, waned that our loss of freedom

would sneak in through passage of quiet, seemingly innocuous
and well-intended laws -- laws like H.R. 1504.

Before you ask, I cut the article out of the newspaper, and did not cut out the part that shows the date of the paper. But it was last week, which means from 22 to 26 May. It was probably the Wednesday or Thursday (21 or 22 May) issue, on the opinion page at the bottom.

I also saw a reference, in passing, to a "beeper law" in Minnesota, which implies that they are already restricted there.

How long before ham radios and scanners?

>
If conditions are ideal, as they have been in past months,
it would be difficult to tell the difference between a station
running 100W and one with 1KW. Being a casual operator on
10 meters, I rarely talk to anybody who is running >100W.

But, I'd guess that if I ever wanted to work YB0 land (wherever
that is) I might expect to tangle with those running
higher power. So, I think of something that Harry Truman
once said about not going into the kitchen if you can't stand
the heat. HI

I do believe, however, that since NEW amateur KW amps
are now being manufactured sans ten meters, the number of
KWs heard on ten will dwindle down to a precious few.

1078. SCUBA and Amateur (HAM) Radio

Newsgroup: rec.ham-radio
Date: 1989-05-31 16:01:40 UTC
From: rbono@necis.UUCP
Message-ID: <1056@necis.UUCP>
Source record: 18460
Cross-posted to: rec.scuba,rec.ham-radio

I am told that I am crazy, but here is what I want to do:

Operate Amateur Radio under water while SCUBA diving.

This is for the fun and learning experience of it! I plan to use
voice (I think the excitment of it would get lost if I used Morse Code), and
would like to work both the VHF FM band (for local, New England contacts) and
various HF bands for world-wide contacts.

But I need some *HELP*! I am looking for some sort of INEXPENSIVE mask or
regulator attachment that would allow me to insert a microphone, and have
full use of my mouth (for talking!). This is a *LOW* budget, probably one
time operation, so I would like to keep the cost as low as possible.

If you have any ideas as to how I could find or contruct a SAFE piece of
equipment for this, or if you might have something I could borrow, or buy,
please contact me!

The dive plan will probably be similar to the following:

All radio equipment will be on-board a boat (on the surface) with
antennas for the frequencies of interest.

Audio cables will be run from the boat to the diver (that me! :-))
who will have a speaker and a microphone.

The boat crew will log contact for the diver (this should keep the
logs from getting wet).

Planned depth of "dive" would be 20 to 30 feet in the Atlantic
ocean (off New England somewhere between Gloucester and Maine).

Dive partner will help with cables, and photograph the event.

Please contact me if you can help in any way. I have been talking about
this for quite a few years now, and would like to attempt to merge my two
favorite hobbies this summer!

Thanks,
Rich, NM1D

In article <25281@beta.lanl.gov> rgt@beta.lanl.gov (Richard Thomsen) writes:
> [...] Representative Kweisi Mfume (D-Md) says [...]
> I have introduced the Beeper Abuse Prevention Act to curtail
> the use of beepers by young people who deal drugs. [...]

Restricting the use of beepers by minors is a band-aid measure if I ever saw one, and next-to unenforcable. Instead, why don't law enforcement authorities use the information on the airwaves to gather evidence and track this drug-dealing. The same could be true of cellular phones used in the drug trade.

My personal feeling is that the airwaves are public and anyone should be allowed to listen, legally. This includes police, amateurs, and, unfortunately, drug dealers. (Note that current law does NOT agree with me on this).

In today's legal environment, police (or DEA, etc.) have to go to great lengths to get a ONE count conviction, since the only admissable evidence they have is often an undercover buy.

However, if this hard evidence is backed up by pager or cellular records, then I (personally) would consider similar pager or cellular activity to be prima facie evidence of other drug dealing.

This is even more true of cellular phones. In fact, when a call is placed to a cellular phone, a "page" is sent out throughout the system. If the phone hears this page, it acknowledges. This signal is easily trackable by triangulation. Normally, this is followed by a "ring" command to the phone. If this "ring" command isn't sent, the phone owner will never know he or she is being tracked.

In conculsion, the technology that drug dealers are using against us can be used against them. I think that this is a better solution that forcing them to abandon this technology in favor of one that cannot help US in the fight against crime.

Try a throat mike. If you can't find the WWII variety any mic element appropriately waterproofed and taped to the throat should do the trick.

I tried getting callsign information from marvin but had no luck.
I telnetted over to the computer and got a login prompt. I typed
a callsign at the login prompt and it then asked me for pw. I then
just typed the callsign over again to see what happens. Nothing
happened. It seems as thought the computer wants me to login before
it'll let me do anything. How exactly do you extract callsigns from
this service? Thanks for your info!

**********| ANARC CLUB-SCAN: May 1989 |**********

The * ALL OHIO SCANNER CLUB's * 5th annual summer meeting & picnic will be June 17 at the Blenden Woods Metro Park in northeast Columbus, 11:30 a.m. - 10 p.m. For directions/more info, contact Dave Marshall (50 Villa Rd., Springfield, OH 45503)... Dave Jones' "Federal View" column in the bimonthly "American Scannergram" is expanding to 12 pages/issue, with a goal of 16 pages if there's enough input from contributors... In the May/June issue Dave describes the new Air Force One and profiles the US Customs radio network; Terry Colgan reports on aerial refueling exercises; and Mark Lucas discusses Global Positioning Satellites...

AOSC address: 50 Villa Road, Springfield, OH 45503 USA; US dues $15.00/year; Canadian US$18.00/year; sample bulletin $2.00 to No America, elsewhere 3 IRCs.
****

Effective July 1st, the * ASSN. OF CLANDESTINE ENTHUSIASTS * will have a new address: P.O. Box 11201, Shawnee Mission, KS 66207-0201 USA... A giant 46-page March/April/May/June issue of "Free Air" has been mailed to ACE members, along with a separate booklet of loggings. There's so much in them we'll have to tell you about the contents in our next "Club-Scan"... Because Keith Thibodeaux's job is interfering with regular publication of "Free Air," ACE is looking for someone else to take on the task. Volunteers should write to the new address (above)...

ACE address: P.O. Box 46199, Baton Rouge, LA 70895 USA;
US dues $16.00/yar; Canada/Mexico US$17.00; elsewhere US$23.00;
sample bulletin $1.50 to No America, elsewhere 3 IRCs.
****

The * ASSN. OF DX REPORTERS' * "Amateur Section" editor, Mike Witkowski, has updated his directory of ham DX nets. Listing 600+ nets with regularly scheduled on-air meetings, it'll be available soon from Tiare Publications... The May "DX Reporter" featured Marty Blaise's comparative test of 5 indoor SW antennas, and an ITU schedule of weather bulletin broadcasts from Canadian coastal stations...

ADXR address: 7008 Plymouth Road, Baltimore, MD 21208 USA;
dues $17.00/year No America, elsewhere by surface mail $19.00/year;
sample bulletin $1.00 No America, elsewhere 5 IRCs.
****

Noting the recent stormy solar weather, Sheldon Harvey offers this helpful reminder in the * CANADIAN INTERNATIONAL DX CLUB's * April bulletin: write to Radio Netherlands (P.O. Box 222, 1200 JG Hilversum, Netherlands) and ask for their free 12-page pamphlet by Dave Rosenthal called "The Solar Guide: How to Use Geophysical Alert Broadcasts"... Elsewhere in April's "CIDX Messenger": Ed Janusz reviews the Selena Vega 215, a SW receiver made in the USSR; Greg Mattson reports on his visit to Australia; Rob Zahora gives readers of his computer column a guided tour of the ANARC BBS; and Dr. C.Q. Gigglehertz explains "The Effect of DX on Brain Waves"...

CIDX address: #61 - 52152 Range Road 210, Sherwood Park, AB, T8G 1A5 Canada; dues USA $25.00/year; Canada CN$26.00/year; elsewhere by airmail CN$32.00/year; sample bulletin $1.00 in North America, elsewhere $2 or 4 IRCs.
****

Marco Vicentini won first prize in * CLUB ONDES COURTES DU QUEBEC's * 1988 DX contest. The award is based on loggings published in the monthly "L'Onde," weighted according to a formula that takes into account the station's power and the great-circle distance from transmitter to receiver... A list of French-language DX shows, compiled by Stephan Blondel and Marco Vicentini, appeared in "L'Onde" a few months ago. With an updated list in the March 20th issue, it looks like this is becoming a quasi-regular feature...

COCQ address: 160 rue Prieur ouest, Montreal, PQ, H3L 1R5 Canada; dues CN$35.50/year, elsewhere CN$37.50/year; sample bulletin (all in French) NA $1.50; elsewhere 5 IRCs.
****

The * INTERNATIONAL RADIO CLUB OF AMERICA's * annual convention will be held June 30-July 2 at the Best Western Heritage Inn, 11269 Point East Drive, Sacramento, California. Registration is US$22, the banquet US$10.95 + tax + 15% gratuity. To register by the June 15th deadline, write Ric Heald, 8539 Bellamy Way, Sacramento, CA 95828 USA... Karl Zuk has been re-elected president of the IRCA. He's also the new editor of Monitoring Times' mediumwave column, and must have caused megawatt heartburn at the NAB when Radio World published his letter defending the unlicensed Radio NewYork International...

IRCA address: P.O. Box 21074, Seattle, WA 98111 USA; dues USA $20.00/year; Canada/Mexico $26.00/year, write to club re other areas; No American trial subscription (10 issues + New Member Packet), $7.50; sample bulletin $.50 in No America; elsewhere 3 IRCs.
****

A detailed 10-page profile of the Ground Wave Emergency Network (GWEN), compiled by Ken Stryker and Dave Wilson, with help from dozens of contributors, leads off the April issue of the * LONGWAVE CLUB OF AMERICA's * bulletin... Much of the rest of the issue is devoted to the theory and construction of large broadband loop antennas, plus Mike Mideke's quarterly propagation report...

LWCA address: 45 Wildflower Road, Levittown, PA 19057 USA; dues $12.00/year in No America, elsewhere $20.00/year; sample bulletin $1.00 in No America, elsewhere 5 IRCs.
****

The April "DX World," published by the * MIAMI VALLEY DX CLUB *, ran an editorial by Dave Hammer on the relationship between hams & SWLs that stirred a heated discussion at the Dayton Hamvention... Elsewhere in that issue, Mark Lucas reviews propagation in the month of March, Brad Lovett describes the "poor DXer's BFO," John McColman tells how to restore 800 MHz coverage on the PRO2005 scanner, and [anonymous] lists WHCA/Secret Service frequencies...

MVDXC address: 4666 Larkhall Lane, Columbus, OH 43229 USA; dues US$8.00/year; sample bulletin $1 in No America, elsewhere 3 IRCs.
****

In the * NATIONAL RADIO CLUB's * "DX News": Dallas Lankford tells how to build a circuit for combining a loop and inverted-L antenna to obtain a cardioid response pattern at mediumwave frequencies (Feb 27)... Pete Taylor describes his "Latin American DX Trip" aboard the Royal Viking Star cruise ship and onshore in Peru, Ecuador and Panama (April 24)... Jack Woods summarizes several scientific articles about "The Effects of Weather on the Ionosphere" (April 24)... And Eric Bueneman is reviving NRC's column for FM broadcast DXers...

NRC address: P.O. Box 118, Poquonock, CT 06064 USA; dues USA $24.00/year, Canada $25.00/year, elsewhere write to club; sample bulletin $1 in No America, elsewhere 3 IRCs.
****

Harold Cones, chairman of the * NORTH AMERICAN SHORT WAVE ASSN.'s * Editorial Committee, has announced the formation of a Graphics Committee "to develop unique and professional mastheads for the columns" in "FRENDX." A contest is being held to pick a new NASWA logo.... Roland Archer's April "DXers Forum" tells of a neat widget due out soon from Kiwa Electronics (9815 61st South, Seattle, WA 98118 USA; phone 206-722-KIWA): an outboard synchronous detector/audio amp combination. "The MAP [Multiband AM Pickup] completely replaces the detector and audio stage of any solid-state receiver with a 455 kHz IF." Anticipated price: about US$340...

NASWA address: 45 Wildflower Road, Levittown, PA 19057 USA; dues $18.00/year worldwide by surface mail (for airmail delivery of bulletin, write to club); sample bulletin $1 in No America, elsewhere 5 IRCs.
****

In the March "Club-Scan" we noted a reference in "SPEEDX" to the trial of a group of radio monitors in England. Rickey Stein's "International" column in the May issue of the * RADIO COMMUNICATIONS MONITORING ASSN.'s * newsletter is entirely devoted to that case. Five south Londoners were convicted of violating the 1949 Wireless

Telegraphy Act, fined nearly L8,000 plus court costs, and over L10,000-worth of radio equipment was taken from them. Their crimes included "listening to various frequencies, inciting others to listen to them, publishing lists of them and disclosing information heard on them"... Paul Bastian is the RCMA's new "Low Band Skip" editor... Editors are needed for the RCMA's "Monitoring & the Law" and "Digital Communications & Computer Corner" columns...

RCMA address: P.O. Box 542, Silverado, CA 92676 USA; dues $18.50/year USA, elsewhere $22.50/year; sample bulletin $1.50 in No America, elsewhere 6 IRCs.
****

Nominations are open until June 1st for * SPEEDX's * Board of Directors. The candidates' statements will appear in the summer issues of the bulletin... Kent Willis continues his tutorial on audio filtering in the April "Technically Speaking" column...

SPEEDX address: P.O. Box 196, DuBois, PA 15801-0196 USA; dues $20.00/year worldwide for surface delivery of bulletin (write to club for airmail rates); sample bulletin $1.50 in No America, elsewhere 8 IRCs.
****

The * WORLDWIDE TV-FM DX ASSN. * is all agog at what the solar cycle is producing: trans-Pacific TV DX, first reported by Gordon Simkin in the May "VHF-UHF Digest"... The WTFDA's annual convention is August 4-6 at Bill Kretschmer's house (104 Kopp Ave., N. Syracuse, NY 13212). Attendees must make their own motel reservations. Registration, due by June 1st, is US$35... The 12th edition of the "FM Atlas" is due out next month: US$11 postpaid from Bruce Elving, 241 Anderson Rd., Esko, MN 55733-9413 USA... There was a nice write-up about WTFDA in the April/May issue of the ham magazine "RadioSporting"...

WTFDA address: P.O. Box 514, Buffalo, NY 14205 USA; US dues $17.00/year, Canada US$18, elsewhere $27.00; sample bulletin $1 in No America, elsewhere 6 IRCs.
....

CLUBSCAN is a monthly feature of the ANARC Newsletter. Subscriptions to the Newsletter are $8/year to US addresses; US$8.50 to Canada/Mexico; US$13 elsewhere. Order from: ANARC Publications, P.O. Box 462, Northfield, MN 55057 USA.

1083. Re: SCUBA and Amateur (HAM) Radio

Newsgroup: rec.ham-radio
Date: 1989-05-31 21:46:00 UTC
From: commgrp@silver.bacs.indiana.edu
Message-ID: <12600061@silver>
Source record: 18453

>I want to operate Amateur Radio under water while SCUBA diving.
>...
>Rich, NM1D

Diving masks with microphones are extremely expensive. A diver friend who is also an MD says that bone-conduction transducers work well for underwater communication. He also says that conventional plug-type earphones should not be used underwater because they interfere with pressure equalization of the ears, and may cause injury if they are forced too far into the ear canal.

A single bone-conduction transducer can act as both microphone and earphone. It mounts behind the ear, under a wetsuit hood. Water improves the coupling.

I don't know where to get bone-conduction transducers, or whether special underwater models are made. Can anyone post the address of a supplier of professional underwater electronics?

Well, they can do that legally only if they get a warrant, the same as if
they want to put a wiretap on someone's phone. Whether or not it should
be that way is open to question.

True.. if you don't want someone to listen to you, you should have to scramble
it yourself, or use landline.

I have been using the MFJ-752C filter on ssb and cw for several years and
find it to be very useful. I use it in addition to a 500 Hz filter in the
KW TS-440S and sometimes stand alone. I would recommend it without
reservation.

<< lineeater munches an SDLC frame with a double-CRC error! Chokes! >>

In article <1191@uvm-gen.UUCP> gdavis@uvm-gen.UUCP (Rev.Gary Davis) writes:
+
+ I wonder if anyothers out there,what with the good prevailing conditions
+on 10 have noticed the excess use of power? I use 100 watts and a 4 ele.

Gary- You're absolutly right! I would like to point out, however, that
the people doing this are NOT Novices or Technicians! A careful look thru
Part 97 reveals that "..Amateur transmitting power shall not exceed that
necessary to maintain communication..". I think some of the OT's have lost
track of that.

Another point: Is there some real reason for those having General and higher
class licenses to run AM phone between 28.3 and 28.5 ?? I KNOW it's legal!
But traditionally, the fellows involved with groups like SPAM, etc have been
recommending that AM phone be run ABOVE 29.0, so as not to clog the lower
frequencies with carriers and hetrodynes.

Yet Another: Contest BOZOS. Yup, that's what I said...who the !@#$%^
are these 'people' that think they can totally monopolize a frequency, for
an entire weekend?!! A lot of us here in the L.A. area use 28.310 as our
main net and ragchew frequency. It also serves us as a calling frequency...,
but don't you know that everytime one of those 'ROTTEN QRM' contests is
running, some idiot will sit there for 5-10 hours straight?! Just TRY and
ask him for a break...He'll give you that "You're 5+9 in DMxx..QRZ?!" crap,
and when you tell him, in a polite fashion, that you'd like to use the freq
to make a call, locally, he'll come unglued! He'll tell you that HE's BEEN
on this frequency for HOURS! What a joke!
My recommendation: Contesters, don't take that silly wall plaque stuff so
damn seriously...it's only a hobby, remember?? ;-) Also, kindly remember that
just because you've been using a particular frequency for several hours to
chase paper doesn't mean you OWN that chunk of the spectrum! Be reasonable.
Be flexible, finish your current contact and ask if anyone else would like to
make a call.

Smaller point: Would those of you running Uniden HR2510's mind turning OFF
the 'Roger Beep'?? Those things serve no useful purpose whatsoever, and only
add to the QRM. Besides, they sound silly..you guys that run those beepers
are making 10 meters sound like 11 meters.

73 fer now,

Because in their fits of lets make listening illegal laws they have made
collecting evidence this way illegal. Thanks to the EPCA criminals have
a congress mandate dexpectation of privacy with regard to these things and
police could not listen to the phone calls without a warrant anymore than
they can tap your home telephone. (Note that the congress punted on cordless
phones, therefore there is no expectation of privacy there and police can
and do snoop on those).

1091. Eskip propogation

Newsgroup: rec.ham-radio
Date: 1989-06-01 12:47:18 UTC
From: GE0233@SIUCVMB.BITNET
Message-ID: <8906021243.AA04819@ucbvax.Berkeley.EDU>
Source record: 18465

I too noticed the E skip opening Sunday-May 14th. There have
been subsequent openings on May 18th, 29th and 30th noted at my
QTH in Makanda (Southern) Illinois. Following are my loggings
for those openings:

DATE TIME(CDT) CHANNEL CALL LOCATION

5/14/89 2120 2 KQTV St.Joseph,MO
2200 5 KGWN Cheyenne,WY
2222 2 KNOP N.Platte,NE
5/18/89 1750 2 KNMZ Santa Fe,NM
2010 2 XEPM Ciudad Juarez,
MEXICO
5/29/89 2016 4 KGBT Arlingen,TX
5/30/89 1958 4 WBC Boston, MA
2000 2 WGBH Boston, MA
2030 5 WCVB Boston, MA
2042 6 WLNE Bedford, MA

The above are confirmed loggings, in other words the station
ID came up and was visually or audibly clear enough for definite
identification. On the night of the 29th Mexico was trying to
come in on 2 and 4 but I could not get a good ID, and on 5/30
Canada was there on 2 and 4 but once again not clearly enough
for an ID though it was certain that they were speaking French
and the commercials were for Canadian products. By the way,
the local stations here which would be E skip candidates are
3 and 6. It takes a strong opening to override these signals.
It does not take a very strong opening to override the St.
Louis stations 2,4,and 5.
E skip TV DXing can be lots of fun and you don't need any
sophisticated equipment to pull in those stations; my $49.95
RCA B&W (rabbit eared) does a fine job (sometimes it does better
than the Sony with a beam and rotor!). Even though I am a ham,
I'm not a 6M enthusiast (yet), so I can devote these entire
openings to chasing TV DX! Good hunting everyone, the E skip
season has definitely arrived.

(1)CALLBOOKS--in reply to the 31 May info-hams question, yes
there is a bbs with USA callbook info...it has the FCC database on
a hard disk and is available for callbook-type info. My querries
have been answered in a few hours. Send packet querries @WA4ONG.
He is in Richmond, VA.

(2)In reply to VE3ZDC's note on Illegal to Operate at Airports, I had
a humerous thing happen to me at the Detroit airport. Had a change
of planes there a few months ago with a two hour wait. Pulled
my two-meter brick out of my brief case and enjoyed several
QASOs with W8's doing a shift change at the Ford plant. A police
man came up to me in the Detroit airport loby and told me not to
transmit because such would be harmful to the airport's navigational
aids. I pointed to the brick on his belt and ask him if he uses
that to transmit in the airport....and why does my brick mess up
the navigational aids while his does not. The cop scratched
his head and walked off.......

You may want to try the Aquavox. It is attached to your regulator and
enables you to talk underwater. If I am assumming correctly, you should
be able to insert a very small mic inside the Aquavox and talk right into it.

For more info. call (407) 783-5672 regarding this device and tell them
what you want to do.

Does anyone out there have the drawings for a coaxial dipole good on ten meters? I am trying to find them. I looked in the Antenna Handbook but I couldn't find that antenna specifically.I know the calculations for for a wire dipole (I built one) but I want to see what the differences are for coax.

I have access to a FAX machine if you want to save postage. Thanks in advance!

Yes, Marvin.cs.Buffalo.EDU will give you call sign info. But you must connect to port 2000 at the specific IP address. You need to connect like this:

TELNET 128.205.32.4 2000

Make sure you have a space and then 2000. You will connect. It will not prompt you for username or password. In fact you will get no prompt. Once connected simply input call sign and carriage return.

When we changed our fire dispatch frequency several years ago I
ordered several hundred crystals from ICM. One batch of pager
crystals must have been bad, because we had eight out of ten crystals
fail within one year. They didn't rattle, and I didn't take any
apart to see what they looked like inside. I sent them back to ICM
and they were replaced promptly without charge.

Has anyone tried to operate 9600 bps single-chip image modems in half duplex ?
Rockwell has such a chip, the R96MFX 9600 bps MONOFAX (R) Modem, which could prove to be an inexpensive (50US$ a chip in Israel ...) way of storing and transmitting image through limited bandwith devices/channels if it can be operated in half duplex or talk-only/listen only modes.

Subject: 'Sweepers'.

I have recently been reading up on 'sweepers', those rough, wobbly carriers that sometimes pass through the frequency you are listening to : particularly on HF.

I have identified two basic kinds : those that are deliberately swept in frequency (radars of various kinds, and those applications where an unknown resonance is to be identified) and those whereby the sweeping is accidental. The latter are mainly 'industrial Scientific and Medical' (ISM) applications : i recently came across a wood-drying system at a factory making replacement doors : they had an untuned power-oscillator (centered on 27-ish MHz) with a power according to the manufacturers documentation, of 10Kilowatts. This device used raw, unrectified AC on the anodes (its a push-pull self-excited oscillator). The 'load' consisited of two metal plates, connected to the oscillator with thick copper braids. A glued-together door is placed between the plates, and the glue is hardened by a 15-30 second burst of RF (the water-based glue is heated by dielectric loss).
There was a bank of four such oscillators in use in the factory concerned. No attempt was made to stabilise oscillator frequency or to screen radiation from the oscillators. The signal could easily be detected 35 miles away on a communications receiver, sweeping over about 130KHz as the glue dried, (somewhere between 5 and 10KHz/sec).
I also know that diathermy equipment (used in hospitals for cauterising wounds, sealing arteries etc) works around 13.56MHz and in many cases several hundred watts are used.

it doesnt take much imagination to see how a powerful, untuned and unstabilised oscillator running off raw unrectified AC can produce a wide range of nasty and ferocious harmonics. With this sort of power, you dont actually need an antenna if you have plenty of lossy leads between the RF source and the load. Some of the oscillators use water:cooled anodes on the tubes : none of the ones i saw had the slightest attempt to prevent RF leaking out onto the copper water cooling feed pipes.
Imagine a number of these oscillators in use on the top floor of a factory or hospital complex : with the right propagation conditions their ability to be heard over phenomenal distances is quite understandable. One or two really bad ones could easily drift HF and intrude on 14 or 28MHz with their raspy wobbly carriers. Since they arent 'transmitters' in the normally accepted sense, they undoubtedly fall into an odd area as regards the legislation and getting them suppressed.

Surely the time has come for the production and use of these things to be stopped : i accept that RF has its uses, but why cant the things be adequately stabilised so they dont drift off frequency, and also used in shielded rooms (do metal:framed buildings act as faraday-cages i wonder?)

By default, telnet connects to socket number 23. The marvin server is running on socket number 2000. The way you would most likely access the server is with the command:

telnet marvin.cs.buffalo.edu 2000

When connected, just type a callsign and you're on your way. Let me know if you have problems. 73...

^^^^^^^^ HOW BOUT NOW!!! (900mhz phone svc)

Hey Folks , Its all downhill since they Approved the ECPA, lets face it,
It was cheaper to lobby washington, than put scrambling/cypher logic
in cellular phones. Yunno, dont fix the problem, make it illegal, yea
thats the ticket 8-). Gee the bad guys wount listen if they know its
illegal right? What a joke, and as usual the consumer, and general public
are the ones getting screwed.
Now i guess the police need a wiretap order to "listen" on the airwaves for
drug dealers. It USED TO BE PUBLIC airwaves. seems counter productive to me.

The beeper thing sounds like desperation legislation to me, but cant blame
someone for trying all they can to solve the problem if they think its right.
But The real problem is drugs comming in, and having a market here in the
first place. Legislate everything that could possibly aide the drug biz, and
its going to get real uncomfortable around here for law abiding citizens.
Tuff questions, tuff answers. Regards, johnd

"ECPA=1st major atrocity against freedom and democracy in america,
in our lifetime"

>without permission of the commander/manager. This includes a handheld.

I was also harassed last year during the 3rd annual ARRL 10 GHz contest when I set up and operated for a short time from the Kent County Airport (GRR) near Grand Rapids, MI. The strange thing is, there was a cop about 2000 feet away at the entrance of the airport with his 10.525 GHz radar unit, measuring the speed of motorists. An airport cop drove up, took a look at the "menacing looking" 2' backsplash fed dish antenna, and told me I would have to leave the airport and immediately stop transmitting. I told him that he was wrong. I have a license from the Federal Gov't. (FCC) that permits me to transmit anyplace in the US or it's territories (but didn't tell him that on board an aircraft or ship it is required to secure permission from the captain first - I didn't want to complicate things.) I further informed him that the airport is part of the city of Grand Rapids, and thus is public property; I had a perfect right to be there. I was off of the road so I was not a traffic hazzard, and I was in a public area of the airport, far away from any aviation traffic. I showed him my license. He still wanted to play rambo-cop, however, and told me that after I left, I shouldn't come back. I told him I wouldn't, and he left me alone. This, (and other experiences I have had) make me very distrustful of police - (Why do they spend almost all of their time giving people tickets for exceeding the speed limit by 5% or so, when there are rapes, murders, drug dealers and users, robberies, muggings, etc.) - I think that virtually all of them are on a power trip. That however is another story.

I don't know what the laws are in Canada, but I do know that Canada is like the US in that EVERYTHING is legal EXCEPT what is specifically legislated against. I suspect that your DOC official may have been wrong, and just backing up his gov't "friend" at the airport. I would have challenged him to cite the law restricting your license on gov't property. (I used to live in Windsor for 4 years, and there was at least 1 occasion on which I violated the alleged law you speak of.) Talk about making criminals out of ordinary law-abiding citizens!

1112. FT-209RH mods resolved

Newsgroup: rec.ham-radio
Date: 1989-06-02 16:07:14 UTC
From: bilbo@navajo.berkeley.edu
Message-ID: <14324@pasteur.Berkeley.EDU>
Source record: 18486

Some time ago I had tried the FT-209 mods as published in the Dec. '87
73 magazine. It hadn't worked correctly, and someone on the net verified
that the jumpers listed weren't correct, but they'd forgotten the correct
jumpers. Well I finally got around to doing the mod, and here are the
results.

The magazine article says to jump pins 1, 7, 9, 10, 11, 13, and 16.
In every 209RH I've opened, pins 1, 9, and 13 are already jumped.
Adding jumpers 7, 10, 11 and 16 allows "out-of-band" transmission.
But the receiver becomes thoroughly confused, and is not tunable.
The solution: DON'T jump 11 and 16.

So the final steps are:
1) Add jumpers to 7 and 10.
2) Give the VCO can a 1/2 turn clockwise if you're moving to higher freqs.
3) Reset radio and reprogram rcv and xmit freqs, and rptr offset.

Hope this helps!

Bill -KI6DG

All the usual disclaimers apply.

Not all of them. I know several pesonally. Some are and some are not.

I do suspect that law enforcement ADMINISTRATION is not emphasizing such
things as rapes, murders, drug dealers and users, robberies, muggings, etc.,
as much as they could because they are hoping that with a high rate of
crime for a while, they can get some laws passed (like restricting out rights
to own guns and radios) that will make their jobs simply easier to do at the
expense of OUR liberties.

This guy really should have been pursued on this issue. If the property was
open to the public (just because the city owns it does not mean so) the he
cannot tell you to leave except under the policies of the city. If you are
on MY property, I can tell you to leave if I want to, and can base it on the
fact that you are operating a radio transmitter legally. What you might want
to do is write a letter asking the city where they do not allow licensed radio
transmitters to operate. Write it to the city's legal counsel.

> Talk about making criminals out of ordinary law-abiding citizens!

Canada is NOT like the US. There are a lot of social similarities, but
the laws in this country are expected to allow people more freedoms.
Of course it is the power trips of certain police officials and POLITICIANS
that end up changing things (here AND there) for the worse. The thing is
here, authority is defined as deriving from the people. In many other
countries (don't know about Canada) this is not the case; people are
servants of the government.

> ----> Abortion is murder; Affirmative Action is discrimination. <----

Even though I agree, it is not the place of the government to impose those beliefs on the people, nor some people to do so on others. While all murder is immoral, government should only be concerned with it for the purpose of making civilization function and not to impose a selected morality on all.

frequencies for V.O.A.'s Chinese service.

According the Voice magazine [the program guide published by the
V.O.A.], V.O.A. Chinese service is on
5955 7285 9660 11965 15410 at 11:00 - 15:30 UTC
6130 7200 9545 11925 at 22:00 - 02:00 UTC.
The new 1 mega watt medium wave frequency is 1142 khz.
From: dong@osgood.harvard.edu (Rui-Tao Dong)
Path: osgood!dong

The anchorwoman of CCTV English service Wei Hua [interviewed by Ted
Koppel on ABC Nightline a couple of weeks ago] was told not to be
interviewed again, otherwise she's going to be fired.

In MediaNetwork by Johnathan Marks, the host mentioned that
since yesterday [I assume it was may 30], the Chinese authority had
intensified the jamming of the V.O.A. The Central People's Broadcasting
Station (Zhong Yang Ren Min Guang Bo Dian Tai) [I am not sure it is #1 or
#2] moved to the V.O.A. frequency 15410 khz at 10:00 - 15:00 UTC. [I tried
to monitor the frequency at 13:30 UTC, the V.O.A. Chinese still came in load
and clear in Boston.] the other two previsely unjammed frequencies 17890
and 21585 khz are now being jammed by noise jammers.
Before the end of the show, the host mentioned that a while ago
somebody at the Asian Broadcasting Institute in Tokyo called [I didn't get
the name] in and told him that all V.O.A. Chinese frequencies were now
being heavily jammed.

As always, my personal comments and observations are in [.....].
Any thing else is from sources indicated above.
The mail service here is far away from being reliable. If you have
tried to contact me and didn't get my response, please try again.

1115. Radio Manual For Free

Newsgroup: rec.ham-radio

From: tjk@csd4.milw.wisc.edu
Message-ID: <2741@csd4.milw.wisc.edu>
Source record: 18489

I have the following manual:

T.O. No. 08-10-105

Instruction Book for Operation and Maintenance of
Radio Set SCR-552-A
Radio Set SCR-552-T2
Radio Set SCR-542-A
Radio Set SCR-542-T2

dated 16 February 1943 (revised 4 September 1943)

This is instruction and repair of WWII vintage aircraft radio set. If you have one of these and want the manual, send me an e-mail message and it's yours. I'd rather give this to someone who needs it for the radio than someone who wants it for nostalgic reasons. Schematics are included.

This is disturbing at the least. I guess the next thing they'll do is make 49 MHz HT's illegal, then when that doesn't help, they'll say that only licensed persons can purchase ANY radio equipment, then when THAT doesn't work then they'll say that only the police can own radio equipment.

This could be extended to anything. Cars are used to distribute drugs. I guess next they'll make you swear you aren't gonna sell dope out of your trunk. I do anticipate more restrictions on automobile sales in the name of The War On Pollution. Why not The War On Drugs too? People can relate to that. Just show those horror films of kids in cars blowing dope.

This War On Drugs is getting really scary. They have finally found something sufficiently abhorrent to the typical Bozo that they can justify taking away any right they wish in the Name of The War On Drugs.

It's a scary time....Sorry about the ranting. This just upsets me greatly.

I have a simular problem with my AT clone on RTTY. Would you believe
a S9? makes it rough to work weak DX.
The major help seemed to be opening up the power supply and installing
a line filter receptical in place of the recepical and capacitor filters.
I got a stancor line filter at R&D electronics in Milpitas. Fits right
in the old hole, so no sheet metal mods. The next biggest help is installing
the split RFI chokes on the cables coming out of the interface cards. The
video cable needs two or three, the serial port and others seem to use one
or two. I am now down to about S2. My monitor is a NEC multisync and
supriziingly it was well protected. Had the line filter and the insides
were well shielded. You might need to work on your monitor also.

Hope this helps

Of course your boat crew will need to include a licensed amateur that can qualify as control operator. I don't think being under 20 feet of water qualifies as being at the control point.

My original suggestion would be to use a piezo element on the face glass, possibly as both mic & speaker, but I like "bone-phone" idea better.

Another thought about PTT methods. Does submersed noise preclude a VOX. I'm not a diver, but diving movies seem to have a lot of bubbling and gurgling going on.

Good luck, think you'll be ready by field-day?? . .. ... O-)

+I went to the local Radio Schlock today to look at the Pro-2005 after
+reading glowing reviews, and after being happy (- desense :-( )
+with the 2004 that I own. I was shocked to discover that there
+is no mobile mounting bracket for the gadget, and now simple
+way to do it (no bolt holes available for mounting)! It looks
+like one would have to make some sort of sandwich to hold on to
+it! This is pretty bad - They make it smaller, with a better
+keyboard for mobile use, and then they leave out the mounting bracket!
+Also, in keeping with their strange policy, they don't have a
+removable power cord.
+ Sigh.
+
+If anyone comes up with a good mounting for this thing, or finds
+an after-market one (business idea, anyone?), please post.
+
I think that if you look at any advertising they have about that unit, they
will advertise it as a home/base unit, not mobile. Is there even an adaptor
on it for a 12v hookup?

> paging devices by persons under age 21.

This is singly the most offensive piece of legislation I have ever heard
of.

I can still recall, at age 13, being thrown out of a radio shack
because they did not want "children" in the store. (If anybody
wants the specifics, the Radio Shack is in Holbrook, New York, and
as a successful engineering student of age 20 still refuse to enter
the premises).

The misguided 'Kweisi Mfume' is proposing a law which will not restrict
"the use of beepers by young people who deal drugs" -- it will restrict
the use of beepers by young people PERIOD! I had a beeper at age
16, and it was completely useless but was a lot of fun, and it was my
money to spend on the service. I have never dealt drugs, nor have I
even tried them, nor have I ever been even slightly drunk.

I will certainly write my legislative representatives with regard
to this nonesense, should it ever in fact reach New York.

>this radio? Thanks in advance.
>
> Mike Koziol WA2BRX

I recently traveled to Scotland and picked up a copy of "Practical
Wireless," which had an ad for the Icom IC-2SE. Here are some of the
features listed:

- slim and compact: 49(W) X 103.5(H) X 33(D) mm with BP-82 battery,
270g
- simple design: includes both simple and multi-function modes (not
explained further in this ad)
- tuning, squelch, volume controls, BNC connector, external DC power
pack and external mic connectors on top
- LCD function display, call channel switch, function switch, VFO-
memory switch on front (no touch-tone pads)
- 5 watt output power at 13.8V DC
- 48 memory channels
- power saver
- built-in clock with timer functions: xcvr turns on when real time
matches a pre-programmed time
- VFO and memory scan
- auto power off timer function
- priority watch
- battery packs are BP-81 through BP-85, 7.2V from 110mAh to 1000mAh
and 12V at 340 mAh
- other accesories (all apparently new) include desk charger,
cigarette lighter cable, speaker/mic, headset and carrying cases
- neither the transmit nor received frequency ranges were mentioned
in the ad
- no pricing info

Hope this gives you some of the info you wanted.

I recently purchased a dirty, battered ICOM 22A for use on Packet Radio.
It lacks a Users Manual, Service Manual and Schematics. I would like these
documents so I can gain that air of confidence and fool others into thinking
that I know what I am doing. They will also come in useful for modifying and
repairing the unit.

Also if anyone has any hints on using these things on packet I would
appreciate it.

The address to mail stuff is:

Julian Macassey, N6ARE
742 1/2 North Hayworth Avenue
Hollywood
California 90046-7142

I do suggest you mail or call before shooting stuff to me otherwise I
may get buried in manuals.

Yours

From: price@MARLIN.NOSC.MIL
Message-ID: <8906032003.AA01274@marlin.nosc.mil>
Source record: 18498

I haven't used the RS-10/11 satellite for several months, and decided to renew my acquaintance this weekend in anticipation of using it during Field Day.

But, the satellite was nowhere to be heard to its appointed hours, according the my Quicktrack printout. So, either it ain't there anymore, or the parameters have slipped over time to where my Quicktrack (which hasn't been updated in a while) is putting out orbits that bear no resemblance to reality.

If RS-10/11 is dead, please advise. If not, would someone be so kind as to give me AOS/LOS times for a couple of good Western US passes so I can compare them with my Quicktrack printout. Any passes for the next few days would be fine.

If someone is using the satellite regularly these days, can you tell me is make that if the 15 meter uplink is still operating? We tried real hard last year on FD, but apparently only the 2 meter uplink was on at that time and I've not tried to pick up RS-10 since.

Thanks in advance--Jim, K6ZH, ARPANET: PRICE@NOSC.MIL

I would like to thank the following people for the Pro-2004
modifications:

Matt A. Mathews (mam@gvgspd)
Robert Casey (rfc@philabs.Phillips.Com)

With their help, I now have the modifications of the following:
* Restoring the 825-849.995 and 870-889.995 Mhz Coverage
* Adding 100 channels to the scanner
* Turbo Scan
* The (unusuable) S-meter
* Squelch Modification
* Carrier Operated Light

I will compile all of the articles, and post them in a future date
on this net.

HOWEVER, I am still looking for modifications for the following:
* More modifications for the Pro-2004
* The TH-215
* The Kenwood 4100a

Please E-mail them to me at "pacbell!sactoh0!mholtz" with the
subject "Modifications". Thank you in advance!!!!

For those parts and tools to help you install your rice burner in the family chariot, there is a company that: 1. Has the stuff. 2. Has an 800 Number. 3. Accepts Visa and Mastercharge (Access).

For Bird watt meters, antennas, electric screwdrivers, special hole saws for macho "hole in the roof" antenna mounting, and little pedestals for mounting Cellular junk. These mounts can also hold your jappo led display box on the transmission hump so you can read the dials. You will also cease damaging your knees when you leap from the heap cos the radio is no longer crammed under the dash of your Yugo.

The company is called Tessco (No connection to the UK super-market chain Tesco - I asked) Their number is: (800) 638-7666. They take plastic. Ask for a catty

1128. On the Glass Antennas

Newsgroup: rec.ham-radio
Date: 1989-06-04 00:41:19 UTC
From: julian@bongo.UUCP
Message-ID: <222@bongo.UUCP>
Source record: 18503

Some time ago there was lively debate on the efficiency and usefulness of glue on the glass antennas. These are commonly used in the Cellular Phone industry. Want to know what I am talking about? Look at any Yuppie-mobile (Porsche, BMW, Mercedes, Jaguar). Anyhow some people said that they worked fine and others said a 50 Ohm resistor in a tin can worked better. Someone mentioned that the type of window being stuck to mattered. They mentioned defrost wires embedded in the glass. Well we may have something here.

A company called Tessco "Super Savings on Cellular Products" sells a device called an "Antenna Specialists KAV-850 Glass Tester". Yup made by Antenna Specialists who bought Avanti, the originators of the glue on the window antenna. The Glass Tester is attached to a digital capacitance meter and the probe placed on the glass for a reading. They suggest you can move around on the glass to find the best spot or determine that the glass is unsuitable for antenna mounting.

To quote from the blurb in the catty:
"The reasons for failure are many: some glass has a high carbon content for tinting; some glass has a thin metallic layer for current conduction to de-ice; others may have wire mesh as thin or thinner than a human hair (the high dollar imports). And the newest development that causes problems is plastic composite glass, a recent design to reduce breakage in accidents."

So maybe that will explain the various degrees of satisfaction with glass mount antennas.

Personally, I think you can't beat an antenna on the roof. It is as high as you can get it, it is not shielded by any body parts and the whole damn roof is a ground plane. Corvette owners eat your hearts out and stick with the glass mounts.

** UoSAT-D News **

The operating system for the UoSAT-D PCE is now running in Torrance, California. The UoSAT PCE Software Development Model, a complete hardware prototype but without all of the memory present, arrived at Quadron Service Corporation 10 May 89, with the documentation trailing along behind by two days. Quadron has donated their commercial multi-tasking operating system for use on UoSAT-D and on the AMSAT-NA Microsats.
